The following Report was presented to the Agricultural Society by Mr. Mitchel, from the committee, on the subject to which it relates, at its meeting on the 17th instant, and ordered to be printed.

To the Agricultural Society of East Florida, on the Cultivation of the Orange Tree. The Committee charged with the duty of re-

porting on the cultivation of the Orange Tree,

submit the following observations.

From the effects of the severe frost of February, 1823, it would seem that a line drawn from liable to deform St. Andrew's Sound in Georgia, to the entrance diseased limbs.

having its feet armed with claws that cannot be of the river Apalachicola, would mark the northern limits of the Orange region, and in every part of Florida south of this demarcation, the Orange tree meets with a congenial climate. Its cultivations has hitherto been circumscribed to the vicinity of St. Augustine and St. Johns, although there are extensive groves of native sour and bittersweet orange trees throughout all that portion of the territory, recently occupied by the

> There is an obscurity in the annals of the Territory, which has prevented us from tracing the sweet-orange tree to its first introduction, but many circumstances induce the belief that it has been imported from the West Indies and from the south of Europe. Its longevity is traced to 116 years in this territory, and trees of this age seem to be as vigorous and fruitful as those of 20 years. In France this tree is traced to the

age of 560 years.

The sweet orange tree is of easy propagation from the seed, as most of the seeds are prolific: they should be sown from one to two inches under the surface of the ground, and in rows sufficiently separated to leave room for hoeing; after

The orange seed should be sown as soon as may If they do, and several couples of this species of sown at any season, but the greatest enemy to And as nurseries are now established, those

> The operation of transplanting may be performed with safety at any season of the year, and upon trees of any age, if precaution be taken to loss of time. avoid the hottest and driest waather, which loconyenies usually happens in July, and the coldest weather of shipping oranges and confining them in mass in February; but this operation should be limit-in the holds of vessels: these might be obviated

ed as much as possible to young trees.

In transplanting large trees, if they be removed from a good soil to a better, they require no

In transplanting large trees, it is economical to leave exposed the fragments of roots from whence the territory, and, like the sour orange tree, they were separated, as each radical will produce

The sweet orange tree may be propagated by

In setting out groves, the trees should be placed in a quincunx adjustment, and 23 feet apart; by this arrangement, each tree is in the centre of a circle of six others, and all of them equidistant from each other, and groves will embrace 100 trees to the acre; this scale has been approved of near the sea board, where safety against gales of wind ought to be considered. On the St. John's and the interior, where the climate is more moist and tranquil, there is more scope for the exercise of taste, fancy or caprice, in the arrangement of groves.

The orange tree delights in rich soil, and cetric acid. when it has the advantage of this, it will bear fruit, in 6 years from the seed, and will attain its full size in about 12 or 14 years; when it is con-templated, therefore, to establish a grove in poor land, an attention to manure will save much time and labor: for in such land the tree is not only retarded in its growth from the want of nourishment, but the branches are subject to be blighted by the sun in July, and by the frost in February. In good land the orange tree grows the extreme branches of the whitos from half with vigor and symmetry, in inferior land it is trees left for shade on his farm ameter were liable to deformity from suckers and blasted and an inch to an inch and a half smooth and as

In rearing a grove ft would be attended with benefit, if the trees were washed once in two years with sand and water, to remove whatever fungus may have gathered on the bark, and if a little attention were given to pruning the interior foliage, with the view of promoting a vigorous and extended ramification.

The orange tree rises to 36 feet in height, and ramifies nearly to the same extent. The largest quantity of fruit which we have yet ascertained, s 6000 oranges to one tree, on the river St. John's, and the quantity of 3,500 is of frequent occurrence both in that quarter and in the vicinity of St. Augustine. The groves of the territory have not yet attained sufficient perfection to furnish data for computing their produce in the gross, for in general large trees and small are blended together. In this imperfect condition, however, the product of the groves in St. Augustine may be estimated at \$500 per acre. But on whatever scale a computation may be made, whether upon 1000 oranges to the tree, or upon 5000, when it is considered that groves may be raised under circumstances requiring from the planter scarcely any abstraction from his ordinary avocations, it will be evident that with the exception of the olive, there is no plant so produc-

of time necessary to raise it from the seed; but, on the other hand, it ought not to be forgotten that this process requires no advance of capital. planters who may be unwilling to exercise patience, will have an opportunity at a moderate expense, of setting out groves without much

Inconveniences have arisen from the practice by the adoption of some cheap and convenient mode of packing them for exportation. therefore recommend that the Society should promote inquiry, and offer a reward for the best communication on the interesting subject.

The bitter sweet orange tree is indigenous to they were separated, as each radical will produce a distinct tree, and in a shorter time than from the seed.

The sweet crayes tree may be proposed by: of the orange tribe, and it hangs on the tree in perengrafting and inoculation upon the sour and upon the bitter-sweet orange trees.

of the orange tribe, and it hangs on the tree in perfect preservation for twelve months after maturity and has been in common upon the later. ty, and has been in common use among the Indians and negroes, as an article both of refresh

ment and food.

The sour orange tree is more generally known, from its juice having been exported. From its hardy character, it is frequently raised on the sea board, to protect groves against gales of wind. And, in concluding this report, we would merely mention that the sour orange tree may be applied to other important uses, the one for the purpose of engrafting sweet oranges, the other for preparing the orange peel for confectionary; and, lastly, for applying the juice to the fabrication of G. W. PERPALL. W. SMITH.

P. MITCHEL.

THE TEA TREE.

are the principal evi s arising out of this practice: To the second, there has been but one obmer, that a strange impression exists in the mind of the same nature, it is only by experience that jection, and that certainly a very serious one; I, of the writer as to the plant to which he alludes. of course, have allusion to its early decay where Arguing from the position, which I suppose him the post comes in contact with the earth. To re- to have assumed, namely, that "he has raised medy this evil, has been the subject of my attention, and I flatter myself with the belief that I the Hyson Tea Plant, which is nearly ready for a farmer, and having planted cotton for many shipping," my only subject will be to show from years past, I might, perhaps, without incurring the description which follows, that your correstable of all dead wood fences. I have a line of it

wards the base than the point: it is coriaceous, very dark green, not at all rendulated, and the face of the ground. The space, of course, which the sill occupies to be first levelled where the ground is uneven. The rails are then placed in the posts in the usual manner;* the only differthe climate of England, in exposed situations for thirty years—the Bohea will not stand without the protection of a frame or green-house in the winter season. I have both the plants now growing in pots in my garden. We learn from Keemp-fer, that the different sortments of tea are made my, be dressed out than the posts on the old plan, particularly where you have the advantage of a during the times of collecting the leaves, and saw mill. The sills may be used out of any rough or misshapen timber, that could only be considering the times of collecting the leaves of these are multiplied according to the goodness of their preparation, by which the varieties of tea are augmented. The leaves are not fit to be already a place behind the fire. There are three ways in which the post may plucked before the third year's growth. In about be inserted in the sill, viz: by a mortice, tapered augur, or dovetail; the last of which I adopted.

THE ROT IN COTTON.

Ouachita, 6th Aug. 1824.

TO THE EDITOR OF THE AMERICAN FARMER.

SIR:-I have some weeks ago seen in one of your papers, a discovery, the most important for the planters of this and the adjacent States, to wit: A remedy for the rot of the cotton. Nothing more interesting could have been offered to the perusal of your subscribers in these Southern parts of the Union; but as a lover of truth I cannot help informing you, that we were, in this section of the State of Louisiana, in possession of that great secret in the manner set forth in the American Farmer, for upwards of seven years. A friend and MR. SKINNER:—Amongst the many labours, as well as expenditures, necessarily attendant on the duties of a farmer in our State, there are none of more consequence, or that give more trouble to him, than his fences. Worm, and post and rail fences are the kinds generally used. To the first, there are many cogent reasons why this courter. near neighbour of mine, returned from an excur-Paris; they told him, that by making a circular incision at the lowest part of the cotton plant, it might prevent it. My neighbour tried it, and even got tools made the most proper to perform the operation; it had no effect, although tried at Sir :- I should infer from an extract of a letter different periods of the growth of the plant. I produce the rot is the one thought of by Mr. rable of all dead wood fences. I have a line of it erected by way of experiment, and am happy to say, that as far as we are capable, as yet, of deciding on its advantages, it meets my most sanguine expectations.

My greatest fear was, that it might be liable to be overturned by the tempest, or by the cattle; but I have had opportunities to satisfy me that it is proof against both. This improvement consists which is planted in the ground, into a sill; or, in other words, of inserting the post in a sill of wood; the but of each post, with the addition of a few inches in length, being generally sufficient for that purpose.

The post and sill I have made of the same

pondent is evidently in error as to the plant under cultivation. It seems to be nearly settled within the plant under cultivation. It seems to be nearly settled within the past few years, that there are two species of gy I can offer, is a sincere wish of being useful to the past few years, that there are two species of gy I can offer, is a sincere wish of being useful to my fellow-citizens—If my view of that subject within the past few years, that there are two species of gy I can offer, is a sincere wish of being useful to my fellow-citizens—If my view of that subject within the past few years, that there are two species of my fellow-citizens—If my view of that subject within the past few years, that there are two species of my fellow-citizens—If my view of that subject within the past few years, that there are two species of my fellow-citizens—If my view of that subject within the past few years, that there are two species of gy I can offer, is a sincere wish of being useful to my fellow-citizens—If my view of that subject within the past subject with the past subject with the past subject within the past few years, that there are two species of gy I can offer, is a sincere wish of being useful to my fellow-citizens—If my view of that subject with the past subject with Bohad, obmy fellow-citizens—If my view of that subject with the past subject wit The post and sill I have made of the same length, but the latter of greater bulk to give firmness to the fence. This post and sill, which may be compared with the letter T inverted L, are between the sills.

* Previous to futting up the fence, I throw two then on the leaves, and finally pervades the whole plant, and often destroys it all. If this is the it is to be built, with a view to close up the opening between the sills.

ated atmosphere? Would not some alkalı neutra-lize the cause? Ashes, or rather lime might d it, I should venture to propose, by way of experiment, to administer the remedy at several stages of the growth; some rows in a field might be tried upon in several ways and at different times-if lime, a little might be put at the foot of every stock, on others some might be slightly thrown on the whole plant. I do not pretend to say, that I am sure of succeeding to destroy the rot by the means I have proposed; but as it requires but very little labour and hardly any expense to try it, I think it worthy the attention of cotton planthe loss of time and expense employed to make the experiment, will not deserve being much regretted.

AN OUACHITA FARMER.

Editorial Correspondence.

Extract dated Savannah; (Geo.) 31st Aug. 1824, are very handsome." "We are troubled with excessive rains after a very serious drought-the combination of the two has injured most crops."

the first parcel I sowed in moist rich ground, of August, 1824:" By DAVID HOSAGK, M. D. F. where I observed, in the fall, many stalks of the L. S." summer's growth living, long after the seed had ripened. I concluded, from this circumstance, in the next number of the American Farmer. that it possessed the properties of the fiorin grass, of growing after the seeds have ripened; but on poorer ground and in dry seasons, as this has proved, it does not inherit this property in as great a degree as the herds grass, which grows very beautifully, through the whole season after the seeds PRICES OF COUNTRY PRODUCE-carefulhave ripened and shed, in rich moist places.

I think the Missouri, however, a valuable grass it is remarkably tender and pleasant to the taste. I observed my observations of summer grafting were transferred from yours to other Journals, which shews the general novelty of the subject. I expected to have given you more light on the subject this summer, but it has been too dry for the operation till within a few days passed; a caution should have been given to summer graf-ters to protect tender grafts from the cold, as the unusual quantity of sap, which is forced into them late, renders them liable to be injured by frost. I lost all my grafts of English grapes, which were inserted on native stocks, and growing at the approach of frost. You may continue to expect contributions of both knowledge and seed from me, as often as I have any of use for you.

It is almost needless to repeat an assurance so often given, that I feel the liveliest interest in

cider (in a clear day)—I then put a table cloth over the bottles to keep the dust from getting in, and let them standuntil I had dined—I then went to work again, and put two tea spoonfulls of French brandy in each bottle to prevent fermentationthen corked them with good velvet corks-after

My time will not permit me to enlarge upon

this interesting topic.

In conclusion, gentlemen, allow me here to remark, that the city of New York possesses advantages and facilities for the various objects of our Institution, greater than can be obtained in any other part of the union. By our commerce and our navy, we have continued intercourse with every part of the globe. The gentlemen employed in the public service of their country, and in part too, men of excellent education and inquircultivating the arts of peace.

Circulars prepared under the direction of this institution, and placed in their hands when they depart from our shores, would secure to us, in a very few years, the vegetable productions of every part of the habitable globe, and in the intercourse between this city and the other parts of

dur common country

The secrets of nature are yet to be unfolded. Her hidden treasures, her countless varieties, and her unnumbered beauties are yet to be presented.

The territory of the great lakes and of the western rivers is a world of itself. How importgigantic work which I have mentioned. Our the owner thereof. course is now open to the depths of the wilderness. In peace and in comfort we can not only visit the walks of civilization and refinement, the towns, the villages, and the cities which have recently appeared in the west as if they were called forth by the potent hand of enchantment; but we can also gratify our curiosity and our love of science, by examining regions where the footstep of the naturalist has never left an impression, or science gleaned a treasure. I say then that the magnificent internal improvements of the state of New-York are tributary to our objects. They facilitate the execution of our laudable designs. They multiply, on a stupendous scale, the means of intercourse, and literally annihilate distance and expansion of territory.

And while on this subject, and removed, as I

No person can become a competitor for prizes offered for Animals or Manufactured Articles, who shall not have given notice in writing of such intention to the Assistant Recording Secretary, before 12 o'clock on Wednesday, the 13th of October; nor shall he be entitled to any prize, unless he shall have put the Animal or Article of-

No Animal will be received after 10 o'clock on

Thursday, the 14th of October.

An Auctioneer will be employed for the sale of Animals on the last day, when it is hoped that in addition to a large stock of improved breeds, which will be offered for sale, the farmers of the neighbouring counties will avail themselves of the opportunity to sell any fine native animals from which they may be disposed to part.

The Directors will assemble at 9 o'clock on the

14th of October, at Thurlow's Inn.

The Circle, and a space, not less than 10 feet, beyond its circumference, and the outer sides of the pens, in which the live stock shall be confined, must be cleared, and kept clear, by constables mounted on horseback, until the Stock Committee shall have completed their round.

The Committee for Implements of Husbandry will make trials of Ploughs, &c. on Wednesday, the 13th of October, to be prepared for the meet-

ing of the Directors.
The committees for Stock, Products of the Soil, and Household Manufactures, will commence their examination at 11 o'clock, on Thursday, 14th.

The land for the trial of Ploughs will be divided into spaces equal to the sixteenth of an acre -a furrow shall enclose them, at the distance of

twenty feet from the outer side.

One Ploughman, who will be selected by the Committee shall be employed throughout. After the ploughs shall have been properly set, by the parties who exhibit them, no persons, except the ploughman, and the officers of the Society, shall be permitted to pass within the line, until the trial shall have been completed, except to repair accidental injury.

For the trials of Oxen, and Horses, at the plough, spaces, equal to the eighth of an acre, shall be defined in the same manner, leaving the distance shall be allowed to pass, except the officers of the Society, and such persons as they shall de-

signate.

The places of deposite for manufactured articles, products of the soil, and all other matters, exhibited for premiums, shall be cleared, and kept clear, by constables, whilst the committees are employed in making their examination.

No person, shall be allowed, under any pretence, to approach any member of the examining committees, during the performance of their du-

If the owner of any animal, offered for premium, shall hold any conversation, with any member, of the Stock Committee, in regard to the merits of the object, which he shall have presented for a prize, after the commencement of the examination, and previous to the award of the directors being declared, he shall forfeit all his claims to such award.

All applicants for premiums for Stock, will be obliged to state, where and of whom, the animals were bought, their ages, and if practicable, by whom they were bred, and how they have of money, copies of the "American Farmer." been fed-for manufactured articles, and products All Household Manufactures, and Implements of the soil, where, by whom, and at what expense,

of the Committee of Arrangement, upon pain of forfeiture of any premium which it might obtain.

No Director, can have a vote, for the award of any premium, wherefor he shall be a competitor. JONATHAN ROBERTS, Esq. President of the Penn-The various committees, are enjoined, to keep sylvania Agricultural Society. secret, their opinions, until they shall be formally

JOHN HARE POWEL.

TO THE EDITOR OF THE AMERICAN FARMER.

THE BUFFALO.

Sir,-I do not recollect to have seen any thing, Mr. Editor, in your valuable paper respecting the Buffalo. Would it not be well to endeavour to civilize this native of our forests; and instead of extirpating the whole race, endeavour to increase and improve it? At present he is hunted and destroyed principally for his skin—the tongue, a great delicacy, is sometimes also taken:-the rest of the carcass, except a small portion for the present use of the hunter, is left for the fowls of the air.

In Asia and some parts of Europe, particularly Italy, the Buffalo is much esteemed as a la-bourer; I had some conversation a few years ago, with Governor Miller, of Arkansas, on this subject. He had broke several of them to the yoke :- they worked well; and he was of opinion that they were very valuable, and might easily be domesticated. We do not know enough of this animal, and I fear, despise him only because

he is a native.

We want a substitute for the Horse as a labourer, an animal that does not cost much-that will live with little or no care; do much work-and after he gets old serve for food. The ox comes near this description. It is probable that the Buffalo is brisker, and equally strong and hardy. The mules between the Buffalo and common cow would probably answer our purpose better than any thing we have ever tried.

0 THE POPPY.

"O gentle Sleep!

" Scatter thy drowsiest poppies from above;

"And in new dreams, not soon to vanish, bless "My senses with the sight of her I love!"

The cultivation of the poppy, with a view to the extraction of Opium, has been urged in this paper, as being profitably practicable, in America; especially by a gentleman who was once personally conversant with its growth, and the prepatention to the rules of breeding, will eventually ration of opium from it; in the East Indies .- It cannot be questioned that he who could, under the existing circumstances of our country, suggest Of Arrangement.—Jonathan Roberts, William Darlington, Richard B. Jones, John G. Watmough, John Hare Powel, Henry L. Waddell, John Wilcox, William Harris, Reuben Haines, Manuel as the political economist who should discover, in England, a new object susceptible of taxation-We are not convinced, it is true, that the poppy can be cultivated here with advantage, but we England, have shown, in varying the forms, and hold the reverse to be by no means certain ;-and at all events we suppose that our readers will be George Blight, John G. Watmough, John Wilcox, finite properties, shapes and even peculiar co-pleased with having an opportunity to read the lours, to whole families of neat cattle and sheep, the facts which we have collected in elucidation can scarcely be believed, except by those who of its culture and application. But, aside from its medicinal uses, as an ornamental flower in our gardens, it has almost unrivalled attractions. ples and practical deductions upon which their in its extreme delicacy of texture and splendid art has been founded, was made some years since colours. Of these last, in all their variety, we were not so fully aware, until we received from a Lady, an esteemed correspondent, a letter from been universally received, by practical men, ex-cept upon one point, wherein he is directly at va-poppies which she describes, were obtained from poppies which she describes, were obtained from seed sent from France to the Philadelphia Agricultural or Horticultural Society, and placed we believe, in the hands of Mathew Carey, Esq. for seph Banks has published an excellent paper, distribution-from him, we received a box containing a variety of seeds for publick use, and which may be obtained by any Ladies or Gentlemen who will call, translate the labels, and take, and carefully cultivate such as they do take,

WORMS IN THE HEADS OF SHEEP-cause discovered-means of prevention described.

DEAR SIR,—Observing in your highly valuable paper No. 24, Vol. 6. a communication from Alexander Reed, on the worms in the head of sheepand having in the following manner acquired some information on the subject which, perhaps may be useful to the public, I willingly give it.

Being always fond of good mutton, or lamb, and believing that the flavour greatly depends on the duration, and its only business to propagate its species. Het them remain two days longer; then

be of a fine red colour, the eyes glistening, the scales brilliant, and the whole fish should feel stiff and firm, if soft or flabby the fish is old.

To improve the quality of fish, they are sometimes subject to the process called crimping.—
The operation has been examined by Mr. Carlisle, to whom we are indebted for the following particles where my flock of sheep was to see which common potagh is common potagh in the skin which add dried over it, so as to slightly coloured by iron, and containing 17 per cent. of free alkali. From this analysis, Dr. Grischents, and discovered that each worm suipling or lime, carbonates or soda and lime, with a very small portion of sand, the whole slightly coloured by iron, and containing 17 per cent. of free alkali. From this analysis, Dr. Grischents, and discovered that each worm suipling or lime, carbonates or soda and lime, with a very small portion of sand, the whole slightly coloured by iron, and containing 17 per cent. of free alkali. From this analysis, Dr. Grischents, and discovered that each worm suipling or lime, carbonates or soda and lime, with a very small portion of sand, the whole slightly coloured by iron, and containing 17 per cent. of free alkali. From this analysis, Dr. Grischents, and discovered that the chrystalist and the common statement of the common sta my pasture, where my flock of sheep was, to see which common potash is sometimes used. As whether the flies were to be found among them, this article is understood to be abundant about the have not taken place, this process may be practised with success. The sea fish destined for crimping, are usually struck on the head when with the nose against the ground; others with their heads under the sides of fences, or bushes. contractibility and the muscles which retain the On approaching near a parcel that appeared restproperty longest are those about the head. Many transverse sections of the muscles being made, and the fish immersed in cold water, the contractions called crimping takes place in about tractions called crimping takes place in about the matter that appeared restrictions about the files about them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from them, of which the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyance from the sheep appeared to have great dream and land conveyan tractions called crimping takes place in about siderable distance, then stop, and place themfive minutes, but if the mass be large, it often reselves in the same position again; evidently to bay, might be effected in 25 days. The following protect the nose from the flies; a thing I had freare the distances and estimated rate of travel: quires 30 minutes to complete the process. The crimping of fresh water fish is said to require hard water, and the London fishmongers usually employ it."

Mr. Carlisle found, that by crimping, the muscles subjected to the process have both their absolute weight, and their specific gravity increasions and their specific gravity increasions. The protect the hose from the files; a thing I had frequently seen before without reflecting on the parent of the worm, and the great pest and annoyance they were to the sheep, whether destructive or not, and that the egg, or larva, was deposited at the nostril of the sheep, from whence it is executed into the hose from the files; a thing I had frequently seen before without reflecting on the parent of the worm, and the great pest and annoyance they were to the sheep, whether destructive or not, and that the egg, or larva, was deposited at the nostril of the sheep, from the files; a thing I had frequently seen before without reflecting on the parent of the worm, and the great pest and annoyance they were to the sheep, whether destructive or not, and that the egg, or larva, was deposited at the nostril of the hose from the files; a thing I had frequently seen before without reflecting on the parent of the worm, and the great pest and annoyance they were to the sheep, whether destructive or not, and that the egg, or larva, was deposited at the nostril of the sheep. ed, so that it appears, that water is absorbed and condensation takes place. It was also observed that the effect was greater in proportion to the vivaciousness of the fish.

It is ascended into the cavities of the nead—i are concluded the only remedy was to apply something that would keep off the flies—for which purpose I had every sheep old and young caught, and the nose of each up to the eyes smeared with the ware then turned into the same field— From these observations, it appears, that the and the nose of each up to the eyes smeared with object of crimping is first to retard the natural tar—they were then turned into the same field stiffness of the muscles, and then by the sudden application of cold water, to excite it in the greatest possible degree, by which means the flesh both requires the desired firmness and keeps lon-fles having entirely left them at liberty to do so.

Since that time I have not omitted to have my Since that time I have not omitted to have my

> I am respectfully yours, &c. JOHN H. RIGGS.

P. S. If you think the above worth a place in

TO RAISE NEW VARIETIES OF POTATOES FROM THE SEED.

Gallatin, (Tennessee,) Aug. 23d, 1824.

or less, of the worms described by Mr. Reed, (in the head) until within the last ten years; some time in the summer of 1814, I killed a very fine fat lamb, and on opening the head, found an unusual number of worms of various sizes—I was thereby induced to try to find out how they origi-nated. I selected eight of the largest and put transplanted them in rows, giving them the same them in a tumbler, with some warm moist earth, distance that other potatoes have; hilled them and tied thin linen over the top, then placed the several times, and I had some potatoes as large and fied thin linen over the top, then placed the several times, and I had some potatoes as large tumbler in a warm and airy situation, where it remained about two weeks, before I examined it. On taking it down, I found a dark grey coloured fly, nearly as large as a honey bee, in it, in shape very much like the common house flies, except the head which was larger in proportion to its apart.—In a word, I think the best way is to.

be of a fine red colour, the eyes glistening, the scales brilliant, and the whole fish should feel stiff and firm, if soft or flabby the fish is old.

Out its contents, and discovered that each worm sulphate of lime, carbonates of soda and lime, scales brilliant, and the whole fish should feel stiff and firm, if soft or flabby the fish is old.

A company has been formed in England to es-

"The crop of cotton from the Roanoke south, sheep tarred in the same manner in the months of May, and June, and have never seen a worm in a sheep's head since that season. when the plant suffers for the want of it—the cause therefore is yet to be learned by me at least. The plan recommended to prevent the rot by a gentleman thro' the "American Farmer," of cutting round and separating the bark of the plant, would be too tedious an operation, ever to be practised to advantage. If the rot should prevail in the cotton in the states south of us also, I am not so sure but it will be an advantage to the planters there as well as to ours—but for the rot or the rust &c. &c. the crop would be too abundant—perhaps more than the consumption of the article-and butchering, I have for a number of years past butchered, or attended to it, for my own table, and have no recollection of ever having killed one in the summer season, without finding more, was laid down, that is, to string the apples and more than the consumption of the article—and if one sixth is destroyed by rot or other disease, the five sixths will bring more in amount.—For if one in the summer season, without finding more, was laid down, that is, to string the apples and more than that of last season, I should expect the it be ascertained that the crop is to be one sixth more than that of last season, I should expect the article to command not more than 10 or 12 cents; whereas, if the growing crop be not greater than that of last year, the article will maintain its present price of 14 or 15 cents."

THE NEW MODE OF OBTAINING WATER.

A correspondent near New Brunswick, New-Jersey, writes thus to the Editor, under date

size, without proboscis or mouth to be discovered by the naked eye, from which I supposed that (like the locust) in its last shape, it was of short is obtained I am to pay him at the rate of two dollars and a half a foot.—If he go down 200 feet, species. I let them remain two days longer; then found three more, precisely of the same size, co lour, and form, had made their appearance; being lour, and form, had made their appearance; being then satisfied that the worms had produced the fles, I took the cover off the tumbler, and turned fles, I took the cover off the tumbler, and turned fles, I took the cover off the tumbler, and turned fless.

ROT IN COTTON.

Quachita Farmer, on the subject of the rot in liberal. cotton. The writer states that his friend was directed, when in France, to make "an inci-sion near the roots," which "was tried without success." The method presented by Mr. Pomeroy, is to remove a ring of bark, leaving the sapwood bare and uninjured.

We think the result of experiments very ably neighbouring States, especially of New-Jersey conducted by Dr. Bracey, and communicated to a and of the Eastern and Western Shores of Macommittee of the Claremont Agricultural Society ryland, a very convenient opportunity of attendof South Carolina, go far to establish the conclusions advanced by Mr. Pomeroy, as the following be one of the most extensive and interesting extract will show: "On a spot of luxuriant cotthe rest of the field, I was induced to try various experiments, such as taking away the bud, twisting the branches, wounding the stalk breaking. ton, which I had observed to rot rather worse than side of Worcester, in Massachusetts. It will be ing the branches, wounding the stalk, breaking CHESTER, on the margin of the Delaware, some the limbs, &c. I found when vegetation was, by distance above New-Castle—of course, gentlemen bouring Courts about the same period my means, interrupted, the rot was uniformly may even leave Easton, in Maryland, in the morn-may very much interfere with the arrangements checked, and the wounded pod either healed up or ing, get on board the steam-boat here in the afspread no farther."

See American Farmer, vol. V. No. 4.

-0-

rod prefixed to the barn of Mr. William Bunn, of Florida, New-York, was struck with lightning on Friday, the 30th ult. Several of the labourers were in the barn—the shock was tremendous, but the destructive element was conducted harmless to the foot of the rod.

Barns at this season of the year are more liable to be struck, than any other buildings of the same height, as they contain large quantities of vegetable matter, constantly emitting a steam, which, rising in the air, serves as a conductor to the lightning. The trifling expense of a lightning rod, and the security which they afford, should induce every farmer immediately to put one up to his barn, where so much of his treasure is deposited.

Flax Machine - A Mr. Roumaga, of N. York, has advertised that he has invented a Machine machine) a man and a boy may break 400 wt. of flax in a day. The flax is taken to the machine without preparation, and by a simple operation is broken without injury to the fibre. The bleaching is effected by another process, and also withfor manufacturing.

Grape Vine .- The New-York papers mention a grape vine belonging to Mr. Shatzel, in that city, only four years old, which covers a frame PRICES OF COUNTRY PRODUCE—caretulgrape house of about 25 to 33; the clusters on which have been lately counted, and found to exceed 700 in number. It is the white or Madeira grape.

AGRICULTURE.

"TREATISE ON SOILS AND MANURES BY A PRACTICAL AGRICULTURIST. "

USE OF THE SOIL.

Correct views of the office of the soil disclose the rationale of approved modes of tillage; if one mode is found superior to another, they lay open the cause of it; and proceeding from courses

nutriment: In these relations, the soil ought to rate in the same manner as manures. contain a certain proportion of common vegetable basis, and of peculiar substances found in plants aluminous, i. e. Clay, including alum; 2. The the earths.

which they flourish most. The plants that have beneficial, will be afterwards explained. bulbous roots require a looser and lighter soil than such as have fibrous roots: and those of the latter, which have short and slender fibrous radicles, demand a firmer soil than such as have tap roots or extensive lateral roots. Hence, when successive crops of the same plant have drawn out from a soil the peculiar properties most adapt. ed to its individual nature, the bed of earth becomes less fit for the same plant, until it has been rested and recruited: while it may be fitter for some other plant of a different constitution than it originally was; though exhausted in regard to the crop which it has long borne, it may be fresh for a new stort of vegetable. In short, the principles laid down in the "Practical Gardener," (introduction to the KITCHEN GARDEN, under the head Rotation of Crops,) are more or less applicable to all the branches of Gardening and Agriculture.

BASIS OF SOILS.

and the true food of plants. With the object tain, and yet barely deserve the denomination of of founding a course of agricultural improve. ment on fixed principles, he has communicated, in the Elements of Agricultural Chemistry, * some experiments. We propose to lay before the reader the substance of his leading conclusions, di vested, as much as possible, of chemical terms; the same branch of rural economy.

Vol., 6.—28.

In the extensive field of his inquiry, he touches water having a channel in the soil affords a white on the principles of many other arts; it therefore earthy deposit when boiled. becomes necessary, in sketching an outline after him, which shall embrace only the department of

"Soils, in all cases, consist of, either a mixture of finely divided earthy matter, +-or of earthy matters not reduced to powder, such as gravel which are experienced to be beneficial, a princi- and other stones; more or less combined with deple is thus obtained for extending their application, composed animal or vegetable substances; saline One great use of the soil, is to afford a bed for ingredients, also, frequently lodge in a soil; and the plant, and a cover for its roots from the sun the earthy matters are frequently accompanied and from the wind; while the roots, by taking hold of the ground, act as stays and supports for the trunk of the plant. The the earthy basis, makes a heat. To bring this cific plants have a preference for peculiar soils in small proportion in which it may be sometimes

The above are the only earths which have been

hitherto found in plants.

Other primitive earths sometimes enter into soils by the pulverization of rocky materials.

TERMS FOR SOILS DEFINED.

The popular terms for soils are seldom applied with precision. What one man calls a marle, another will call a clay; and so on. But if a general circulation and acceptance could be obtained for the principles of definition judiciously laid down by Professor Davy-according to which a soil is to be styled a clay, sand, or chalk; a marle, loam or peat; or a compound of these—the chairy, oxide of from the found in the name: in the name in the chair intelligit dom any occasion to notice it in the name: in

In framing a system of definitions, a soil is to take a particular denomination from a particular kind of earth, not exactly in proportion as that earth may preponderate, or not, over others in forming the basis of the soil, but rather in pro-Sir Humphrey Davy, an illustrious ornament portion to the influence which a particular kind of the English school of Chemistry, is not more of earth, forming part of the staple, has on tillage distinguished by his discoveries in philosophy, than by seeking, with true ambition, to make which a comparative small quantity will give a profound knowledge subservient to the common cold and stubborn character to a soil, the name arts by which the common wants of mankind clayey is often properly bestowed, where the quanare supplied; he has contributed largely to the tity of pure clay to be collected from a given service of agriculture, by publishing his scien piece of land, is but as 8 to 42, compared with the researches into the composition of earths, the quantity of sand which another field may con-

"The term clayey should not be given to a soil which contains less than one-sixth of aluminous very important results from a systematic train of matter;" because less than that will not be attended with the common effects which govern the culture, and limit the crops, for a clayey soil.

The epithet sandy is not an appropriate disand to review the peculiarities of his system with tinction for any soil that does not contain at least candour and independence; concentrating, for seven-eight parts of sand; and sandy soils are to unity of method, scattered articles belonging to be distinguished into siliceous sandy or flinty sand, and calcareous sandy or chalky sand.

The word calcareous, or any denomination im-

† Ibid. p. 15. \$ Ibid. pp. 111, 123. § Ibid. p. 15.

A marle consists of mild lime with a small proportion of clay, and sometimes of peat, with a agriculture, to connect the extracts by details and mixture of marine sand and animal remains; the observations for which Sir H. Davy is not respon- lime having originated, for the most part, from the decomposition of sea-shells.

> A soil may be treated as magnesian, where but a small comparative quantity of magnesian stone s present; as will be explained in treating of imagnesia as a manure.

> The combination of animal or vegetable matter in an inferior proportion with earthy matter, tinguishable by the touch from sand, chalk, or clay,) combined with decayed animal or vegetable substances not exceeding half the weight of the mere earth; the earthy matters may comprehend aluminous, siliceous, or calcareous ingredients, and in some cases be mixed with mineral oxides: according to the proportions of which, the soil may be red loam, brown loam, or black loam; and in regard to the basis, a clayey loam,

> A superior proportion of vegetable matter, that is to say, an excess of this above half the bulk of kind of soil into successful cultivation, the quantity of vegetable matter must, in most cases, either be reduced or counterbalanced by the admixture of some of the simple earths.

> Where a slight tincture of any particular mineral substance has a strong effect on vegetation, this quality should be indicated by a corresponding word prefixed to the principal name for the soil. Thus the presence of either salts of iren, or sulphate of iron, ought to be marked by prefixing the term ferruginous to the denomination taken from the basis, to remind the cultivator that the effect on vegetation will be pernicious, unless he has re-course to an effective remedy. If on the contra-ry, oxide of iron be found in the soil, there is selsmall quantities, it forms a useful part of soils, and has been found to constitute from a 15th to a 10th part of several highly fertile fields; it is found in the ashes of plants. To persons unacquainted with chemistry it may be useful to add, that salt of iron exhibits the crystals obtained from iron by the action of an acid fluid. Sulphate of iron is Copperas, a native kind of which is produced in some soils by the effect of the springs and earths on each other. Black oxide of iron is the substance that flies off from red-hot iron when it is hammered. Iron appears to be only hurtful to vegetation in its acid combinations. See Tests of Soils.

IMPROVEMENT OF SOILS.

Almost all the expedients for improving, enriching, or correcting a soil, known to agriculturists, may be comprehended under one of the following heads :-

- 1. The admixture of Earths to improve the Texture of the Soil.
- Draining.
- 3. Paring and burning.4. Turning in Green Crops as Manure.
- 5. Fallowing.
- 6. Irrigation.
- 7. Applying Earths as Manures.
- 8. Introducing Mineral or Saline Elements as Manures.
- Manuring with Refuse Substances not excrementitious.
- 10. Manuring with Excrementitious Substances.

1. By the Admixture of Earths, to improve the Texture of the Soil.

This is a distinct thing from applying Earths as a manure. It is of avail in proportion as the smallness of the tract, or the value of the plant, to be cultivated, allows the free introduction of new earths, until the staple of the land is composed as desired. Almost all sterile soils are capable of being thus improved; and sometimes the latent pernicious quality which destroys the value of an extensive tract of land, can be corrected without much expense.

The best constitution of a soil, is that in which the earthy materials are properly balanced, so as to combine as many advantages of different ingredients as are compatable, and so as to obviate the defects attending any single kind of earth.

The ground, or basis of the soil, should be well adapted for the admission of air, and for the percolation of moisture, without retaining it in win-

A well-tempered aptness in the soil to absorb water from air, and to retain it in a latent form, is clearly connected with fertility. The power to absorb water by attraction, and to hold moisture without being wet, depends on the mechanical structure of the particles of earth, and the balancing effect of different earth. Thus sand will attract moisture, but will not keep it long under the influence of heat. Clay will long retain water which has fallen upon it, and always keep moist under a humid atmosphere: but in continued dry weather, with summer hearts, the surface of it, being baked into an almost impenetrable crust, is little capable of absorbing moisture .-Hence crude clays form equally bad lands in extremely wet or extremely dry seasons. Chalk is of a middle nature, in this respect. It results, that the soils best adapted for supplying the plant verized chalk, with a proportion of animal or vegetable matter.†

* Elements of Agricultural Chemistry, p. 141. The compound of earth, which seems every where most favornable to vegetation, is that which by various chemical tests. consists of one-third of chalk, half of sand, and a fifth of clay: from a Paper on the Chemical Analysis of Soils, translated from the Italian of Fabbroni, by Arthur Young, Esq. (Annals of Agriculture, vol. viii. 173.) "A fifth of clay:" this proportion is too large; independent of consuma ble or cropping manure; by which the clay should be reduced to one-sixth or lower.

A soil is neither fit for tillage nor pasture, if it consists entirely of impalpable matters,† or of pure clay, pure silica, or pure chalk. Sand may abound in a higher proportion than the more te-naceous earths, without causing absolute barren-ness. Thus a tolerable crop of turnips has been majority of cases be sufficiently determined by raised on a soil of which eleven parts in twelve found to contain 8.9 parts of siliceous sand. the quantity of impalpable earth and finely divi- and examining these by the common lights which ded organic matter be a little increased beyond what a sand plant requires, it will suffice for good returns of barley. Although wheat depends more on a rich staple, happily the constituents of land fit for it are combined with very great diversity. An excellent wheat soil, from Middlesex, afforded 3-5 of sand; the rest was chalk, silica, and parts in 500) that it may be apprehended some for a full and accurate knowledge of the grounds considerable substance, convertible into food for on which success may be expected, or the causes a growing plant, might be included in the chalk. of failure explained and rectified. Chalk may in the next degree form the predon-derating earth of good soil. A large portion of England is chalk; and many of the districts where it is the staple earth, liberally repay cultivation.*

The Warp-land (alluvial soil) in the East Riwarp land, being brought from the higher country by the numerous rivers and streams which open into this common estuary, is composed of a variety of substances. Decomposed vegetable and ting-paper, folded so as to contain a pint of liquid, animal matter should be from one-eighth to a and greased at the edges. fourth of the bulk of the earthly substances, according to the dependence of the expected crop

on the nutritive power of the soil.

Many soils (observes Sir H. Davy) are in popular language distinguished as cold; and the diswith moisture by atmospheric exhaustion are tinction, though at first view it may appear to be compositions* of sand finely divided clay, and pulfounded on prejudice, is as just on philosophical principles as it is consonant to the experience of the farmer. Some soils are constituted for imbi-There is besides, in particular earths, an agen-bing a much greater degree of heat from the rays cy subservient to vegetation, which depends on of the sun; and of soils, brought to the same dechemical affinities, in those earths, for elementa-ry substances floating in the air, or deposited in Soils that consist chiefly of a stiff white cloy, take the soil. Thus, both pure clay and carbonate of heat slowly; and being usually very moist, they lime have an attraction for volatile oils and solutions of oil and saponaceous matters, and for much are similar in being slowly heated; but being dright gravity of a soil assists to indicate the quantity of of the pulpy stuff first disengaged from organic er, they retain heat longer. A black soil contain-remains. Hence a limited proportion of these ing much soft vegetable matter, if the site and as remains. Hence a limited proportion of these arch soft vegetable matter, if the site and as the atoms of either are lighter than the atoms of earths contributes to form a rich and generous soil; because they long preserve in their pores the prepared nourishment of vegetables, parting containing much carbonaceous matter (charcoal,) a soil is analysed, the other physical properties with it gradually as it is drawn by growing plants, or ferruginous matter (iron,) are disposed for action of air or water. quiring a much higher temperature than hale-note, in a sensible degree, the sorts of earth in The properties of a soil may be aggravated or coloured soils. When soils are perfectly dry, its composition, and serve to guide the order in tempered by the nature of the Subsoil. Meat, however, which has not been too long When the analysis of a soil is finished, add the preserved, simply pickled, or corned meat as it is as soon as it comes from the market, but kept unquantities together; and if they nearly equal the called, is but little injured or decomposed, it is til its fibre has become short and tender, as these

ing and wholesome enough.

The property of salt to preserve animal sub soil from a hop garden near Tunbridge, Kent, stances from putrefaction is of the most essential slaughtered, the meat cut up and salted, and importance to the empire in general, and to the afterwards packed, is astonishing."* remote grazing districts in particular. It enables By salting the meat while still warm, and be-the latter to dispose of their live stock, and dis fore the fluids are coagulated, the salt penetrates tant navigation is wholly dependent upod it. All immediately, by means of the vessels, through kinds of animal substances may be preserved by the whole substance of the meat; and hence salt, but beef and pork are the only staple artiment is admirably cured at Tunis, even in the cles of this kind. In general, the pieces of the hottest season, so that Mr. Jackson, in his Reflecanimal best fitted for being salted are those which tions on the Trade in the Mediterranean, recomcontain fewest large blood vessels, and are most mends ships being supplied there with their prosolid. Some recommend all the glands to be cut visions. out, they say that without this precaution meat cannot be preserved; but this is a mistake, a dry ceedingly well calculated for dry salting.

Application of detached Steps in and nutritious. Eight pounds of salt, one pound introduce a little into all the thickest parts; if it ted, and rises in the form of scum, which must be carefully removed.

Beef and pork, although properly salted with salt alone, acquire a green colour; but if an ounce of saltpetre be added to each five pounds of salt employed, the muscular fibre acquires a fine red tinge; but this improvement in appearance is more than compensated by its becoming harder and harsher to the taste; to correct which, a proportion of sugar or molasses is often added. But the red colour may be given if desired, without hardening the meat, by the addition of a little

Meat kept immersed in pickle rather gains weight. In one experiment by Messrs, Donkin and Gamble, there was a gain of three per cent. and in another of two and a half; but in the common way of salting, when the meat is not immersed in pickle there is a loss of about one pound,

Dry salting is performed by rubbing the surface of the meat all over with salt; and it is generally believed that the process of salting is promoted if the salt be rubbed in with a heavy hand. very little salt penetrates, except through the cut surfaces, to which it should therefore be chiefly applied; and all holes, whether natural or artificial, should be particularly attended to. For each Common salt is advantageously employed as an twenty-five pounds of meat, about two pounds of sufficiently cured.

For domestic use the meat should not be salted still succulent and tender, easily digested, nourish- changes do not take place after it has been acted upon by the salt. But in the provision trade, "the expedition with which the animals are

By this method there is no doubt but that the meat is perfectly cured in three hours from the time of killing the bullock; the saltpetre in a very little time strikes through the meat; however, it is always better to let it lie in the harness tubs till the following morning, when it will have an exceeding pleasant smell on opening the har-

barrels, with its own pickle.

AND HUNG BEEF.

Meat, when salted, is sometimes dried, when it gets the name of bacon, ham, or hung beef.

The drying of salt meat is effected either by hanging it in a dry and well-aired place, or by exposing it at the same time to wood smoke, which gives it a peculiar flavour, much admired in Westphalia hams and Hamburg beef, and also three drams of aloes, two drams of carbonate of tends to preserve it, by the antiseptic action of the pyrolignic acid. When meat is to be hung, it need not be so highly salted.

The method of preparing bacon is peculiar to certain districts. The following is the method of making bacon in Hampshire and Somersetshire:-

The season for killing hogs for bacon is between ctober and March. The articles to be salted October and March. The articles to be salted are sprinkled over with bay-salt, and put for twenty-four hours in the salting trough, to allow given as a laxative with good effect. the adhering blood to drain away. After this tion of these seeds forms a forms a mucilaginous

DESCRIPTION

Of a Machine for separating the wild onion, or gartic, from wheat, invented by MINUS WARD, Civil Engineer; with a drawing.

A cylinder, with its surface covered with an elastic cushion, is placed with its axis horizontal. Another cylinder, with its surface covered with sharp metalic points, which points terminate at equal distances from the axes of the cylinder; the distance between any two contiguous points, being about one third part of the breadth of a grain of wheat, is placed directly over the cush-ioned cylinder. This pointed cylinder, has its gudgeons fixed at the proper distance, so as to cylinder: the power being applied to the pointed cylinder, the cushioned cylinder is turned by reason of the points being in contact with its surface. Now the first part of the operation is as follows: The grain being fed in between the two cylinders, upon an inclined plank, by means of a revolving fluted cylinder, or by a shaking shoe, so that one grain shall not interfere with another, the grains of wheat being much harder than the garlic, sink into the cushion and pass through be ted or punctured by the points, but merely roll over the cushioned cylinder, drop down, and are

ed between the metal, of which the points are composed, and the juice of the garlic, being quite sufficient to sustain their weight, they are taken up by the points, and carried round by them, for about one-third part of a revolution of the cylinder, when the second part of the operation commences, which is this: The cloves come in contact with a stationary metalic comb, whose teeth stand in between the successive circular rings of points, nearly in the direction of the tangents to those rings, which slides them off the points, when they drop down over the edge of a plank, placed near the point of contact of the cushioned and pointed cylinders, in the external recess, formed by the arches of the cylinders; thus the wheat is made to fall down, between the edge of this board and the cushioned cylinder, and the garlic to fall down on the opposite side of this board.

Baltimore, August, 1824.

Baltimore, Sept. 6, 1824.

I certify, that I witnessed, the other day, the performance of a machine of the above description, for separating the garlic from wheat, in operation in this city, that it performed to the satisfaction of all present. It is my belief that this machine is destined to be of great utility, and will effect the long sought for desideratum of clearing our wheat from garlic.

JAMES SMITH. Late Agent of Vaccination for the U.S.

INTERNAL IMPROVEMENTS

Projected and prosecuted by, and Capital owned in Philadelphia, taken from Carey & Lea's "Philadelphia in 1824."

The exertions made by Philadelphia for, and the money embarking in, enterprises of internal improvement, have tar exceeded those of any city in the Union. It must be remembered, that, vast as are the efforts of the state of New-York, the city of New York has had no other agency in over the cushioned cylinder, drop down, and are them than lending money on good security and on conveyed to the garner or hopper. But not so interest; whereas the advances made by the citiwith the garlic, which being softer, the elasticity zens of Philadelphia have been hazarded upon of the cushion, presses the cloves against the their own responsibility, and exceed considerably points, with sufficient force to cause them to be in amount the estimated cost of the canals of New punctured by the points, and the attraction exert- York. The gross amount of money advanced for

disease is incident to sheep in some particular pastures, situations, and seasons, more than to others. It seems to be generally produced by poverty and leanness; but, from its contagious nature, will attack also such as are fat. Dogs are exceedingly subject to mange, and readily catch it from each other. The ointment above prescribed will be found as effectual in these animals, as in horses, and the same general treatment is applicable to them. In sheep, the matter discharged mixes with the wool, and drying, forms a hard impenetrable crust, which must be completely removed by soaking and scraping before any application can be effectual. The following has been recommended for the scab in sheep:

Corrosive sublimate, one dram; Crude sal ammoniac, half an ounce; Tobacco water, one pint .- Mix.

A solution of arsenic and potash in water has also been effectual. A considerable quantity of an arsenical ore was, a few years ago, sold as sulphur vivum, by a London wholesale druggist, in various places. As long as it was used as an external application for the mangy complaints of cattle, its real nature was not discovered. At length, an unfortunate person at Sidmouth, in Devonshire, was advised to take sulphur vivum in order to cure the itch; some of this arsenical ore was sold to him as such by a druggist of the town, and taken by the man, his wife, and his child; they all died soon after, and it was then discovered, that the supposed sulphur vivum conconsisted in a great measure of arsenic. There is a variety of mange in dogs called the Red Mange, from the red appearance of the skin that is affected; this is said to be cured by mercurial

FROM THE NEW-ENGLAND FARMER.

It is notorious that many of our most valuable kinds of Pears have of late years been blasted. About the latter end of July, or beginning of August, a blight seems to have fallen on the St. Germain-Vergolouse-Brown-burec-and now on the St. Michael, and many other kinds. The skin appeared in a great measure killed, and the fruit, growing rapidly, was soon covered with dark blotches, and began to crack in almost every direction. As the fruit continues to grow and ripen, I perceive those cracks expand and deepen; -hence I am convinced that the exterior of the fruit has been so far killed as to have been in a great measure incapable of any farther expansion, after being struck with the blight. There fore, as the fruit continues sound at heart, and progresses towards maturity, the cracks continue to widen and grow deeper till the fruit is entirely ruined. As my farm is principally on a slope to the East, and my Pears generally more injured press with the required force upon the cushioned by the blast than some in my neghbourhood less exposed to East winds, I am led to suspect that those winds must, at least, have had some agency in the blight. It is said that little if any of the fruit in Boston suffers in this way, and there almost every tree is so surrounded with buildings, as to be sufficiently guarded against the deleterious effects of blasting winds.

Perhaps some of your more philosophic and scientific correspondents may be able to impart tween the two cylinders, without being penetralight on the subject; and show that there are ted or punctured by the points, but merely roll other sufficient causes why many of our Pears blast, besides their running out by age: and possibly they may be able to oblige the public, by suggesting some sufficient remedy.

Yours respectfully,

J. KENRICK.

Editorial Correspondence.

Extract of a letter dated Columbia, (S. C.) Sept. 10, 1824.

"Our crops of cotton and corn will be very far short of an average production; of the former an immense crop was planted, but the drought has been so excessively severe, and so very general throughout the State, as will, I think, curtail a fourth."

SEEDS.

Experiment, shewing the importance of selecting the first ripe Seeds, communicated to the Trustees of the Massachusetts Agricultural Society, Sept. 1, 1805: By JAMES FREEMAN.

To ascertain whether the ripening of seeds can be forwarded, by sowing those which are the earliest ripe, I have made experiments, all of which have been successful, and on several different sorts. It will be sufficient to mention one only.

In the year 1801, I planted the case-knife beam. The pods first formed, which are commonly those nearest the root, were reserved; and when the quantity of a peck was fully ripe, they were gaththe estate: this amount may therefore be dou- the bean has not degenerated in its quality, the \$70,142,160 ripening of the seeds has been forwarded twentysix days, as will appear from the following table:

Planted.	Gathered.	No. days.
1801, May 20,	Sept. 9,	112
1802, May 11,	Aug. 21,	102
1803, May 10,	Aug. 8,	90
1804, May 8,	Aug. 4,	88
1805, May 6,	July 31,	88

The first column denotes the time of planting the seeds; the second, that of gathering the seeds, which were first ripe; and the third, the number of days which elapsed between the time of planting and the time of gathering.

As in the second and following years I anticipated the time of planting the seeds (by which means fourteen days have been gained, in addi-tion to the twenty-six noted above) to determine what effect later planting would produce, by giving the seeds more advantage from the heat of sammer, in the years 1804 and 1805, I put into the ground a quantity of seed, about a week later than that which was first planted. The event which took place, is exhibited in the following table:-

Planted. Gathered. No. days, 1804, May 14 1805, May 13 86 Aug. 8, Aug. 6, 85

As very little time has been gained in the present and in the preceding year, I suppose I have now reached, or nearly reached, the ne plus ultra. I delay not, therefore to communicate to the Trustees of the Agricultural Society the result of an experiment, which confirms the important truth,-that to ensure an early and good crop, the seeds reserved for future sowing should be those, which are the first ripe, and which are, in other respects, the most perfect .- A. E. Farmer.

-0-APPENDIX

To Doctor Hosack's Address to the Horti-CULTURAL SOCIETY OF NEW-YORK.

LETTER from SAMUEL L. MITCHELL, M. D. to DAVID HOSACK, M. D. on the improvement of Orchards, Apples, and Cider.

New-York, Sept. 3d, 1824.

My Dear Sir,-Since the apple, as an article for furnishing a vinous liquor, has been referred to me for consideration, I give you with pleasure my opinion, as lecturer on botany and vegetable physiology to the Horticultural Society. The tree affording this fruit, and the agreeable drink the latter yields by fermentation, have long exercised the industry and skill of man. And in the convenient soils of the middle latitudes, many proprietors have considered their culture as matters of high moment.

Nor is this an object of surprise. The appletree, in my judgment, produces some of the best fruit in the world. Many varieties gratify the delicious quality; while yet others again recreate the palate with their exquisite flavour. The expressed juice is well known in one of its ferment-

ing stages as cider, and in another as vinegar.

If there is any room for wonder in the case, it is that more stress has not been laid upon the cultivation of the apple, especially in our parts of North America. It seems to me that the region between James River and the Kaatskill Mountains, including New Jersey and all the southern district of New-York, is peculiarly favourable to orchards of this kind. The trees thrive well; are long-lived; bear the heat, cold, and vicissitudes of the weather; run into endless varieties, which varieties are perpetually on the increase; and they bear grafting and inoculation to admiration.

And still, with so many good qualities, the ap-ple has not risen so high in public estimation as it deserves. There are two obvious reasons for the neglect it has experienced.

mind the idea of a wine, or vinous liquor. How-that one of them produced two bunches the first ever excellent it may be, it is consumed simply as cider; and is not exalted to the rank and dignity of wine. The German tongue is more happy in this respect; for it denominates cider by the name of Affel wein, or apple wine. And if we could establish, from "malus," the Latin name of upon one of them. I wish it could be a taile as malic wine, instead of cider, I am confident its character and credit would be inconsidered in perfectly practicable for wind dent its character and credit would be inconsidered. dent its character and credit would be increased.

The other cause is the preference given to the grape, and its produce. The vine, which produces this fruit, has, like the apple, branched into numberless varieties, and proved itself capable of cultivation over most countries of Southern, and ing land, it would be upon other ground. I have some of middle Europe. The vine has steadily there kept pace with improvement and civiliza-tion. The more common forms of the fermented ment to those who do the work. The beast and drink procured from its fruit have been deemed necessary to life; while the more exquisite modifications are classed among the most precious lux-uries. It has also gained, and deservedly, the fatness of the animals, in the excellent condition consideration due to a valuable and important medicine. In addition to the intrinsic worth of elegancies of the mansion, and in the income and this product, which may be called "grape wine," credit of the owner. This association of a graz of the free his inquiry into the effects of ardent spirits or "wine of the grape," our manners, habits, and ing and bread-staff culture with the maximum of upon the human body and mind. p. 17.

ly be friendly or sociable without it.

Attempts were, soon after the settlement of certain colonies, made to render this country independent of all others, by rearing and dressing the vine. Yet the project, though urged by its advocates early in the seventeenth century, at least two hundred years ago, has hitherto been carried but partially into execution. This has probably arisen from the great ease with which wine has been imported from foreign ports and places; and from the readiness with which our bread-stuffs, fish, and other kinds of food, are exchanged for this sort of drink.

I am satisfied, from long and extensive observation, that our country, south of the latitude of about forty-one degrees, or perhaps a little more, will sustain the grape-vine. The fruit produced in the county of New-York and its vicinity, is abundant and delicious. The liquor prepared by Mr. Legaux, from his vineyard near Philadelphia, proves the vine to afford good fruit. The like favourable report has been made of the Swiss settlement at Vevay, under John James Dufour and his associates. And more recently, Thomas Worthington, Esq. has produced for our tasting an elegant wine, partaking of the qualities uniting sight by their diversity of figure, size, and colour; claret to burgundy, from his own plantation in the others satisfy the smell, by their fragrance, of a State of Ohio. The publication promised by William Lee, Esq. a gentleman well acquainted with the cultivation of the vine, and especially in the tracts watered by the river Garonne in France, may be expected to contain the most correct and recent information on the subject.

But it is not to exotic vines only that we may look. Our indigenous species and varieties pro mise something valuable by culture. The scuphernong of North Carolina, from the place where the river Roanoake empties into the Sound, is already known and approved. The luxuriance of the plants in Alabama, may be understood by Mr. tion of the casks and vessels. N. Bicknell's letter, of a late date, from Clarkesville. "The grape-vines grow to an enormous size, and rise to the tops of the tallest pines. I have seen them as large as my thigh, ten feet from the ground. In an account I read a few days since of the progress of the vine-cultivation in liquor. Pennsylvania, it is stated that cuttings are planted, which bear a few grapes the third year. I was conversing with a gentleman here on the sub-English language, is connected with the name it bears. The word cider does not convey to the mind the idea of a spine on release. year, and bore abundantly the second. There is a native kind here, of delicious flavour, having tartness enough to prevent cloying the appetite. The bunches are very long, and three hundred and sixty-four grapes of a large size were count-ed upon one of them. I wish it could be ascer-

> I consider it perfectly practicable for wine of the grape, both of the foreign and domestic stocks, to be produced in the proper soils and climates of the United States, whenever the agricultural citizens shall turn their attention that way. If I should hesitate or object to this mode of improv. ever considered a country abounding in grass and his master are more plentifully fed. The abundance which passes from the field into the barn of buildings and fences, in the comforts and even

cularly under Sect. V. By Fallowing, and the customs, so much resemble those of the people enjoyment for a free and republican people, is alhead Management of Manure from the Home from whom we have descended, that we can hard most indelible in my mind. Every additional acre most indelible in my mind. Every additional acre thus improved is an additional evidence of prosperity, in my sense of the word; and every acre taken from this culture, and turned to something else, even to the culture of the vine, may be considered as withdrawn from the more interesting business of yielding food and its accompaniments.

The planting of the apple-tree is not liable to this remark. It is consistent with the full exercise of the plough and the hoe, the scythe and the flail, the mill and the tannery. The manifold uses of this fruit are universally known. How, nevertheless, can I forbear to mention the Swaarapple of Poughkeepsie, the Spitzenbergh of Kingston, and the Pippins of Newtown? New-Jersey has become famous for the cide: of New-.Virginia is proud of her Hughes's crab -N. York dwells with satisfaction upon the praises of Paine'stred-streak : and our fellow-citizen, William Cumberland, has been specially occupied for a considerable time in practical trials to bring cider to that degree of purity and excellence, entitling it to the appellation of apple wine.

I really wish, that farmers would turn their thoughts more seriously to the apple, and its vinous products.

The points more immediately worthy of observation, are, among others, the following:

1. The selection of the best fruit for making the particular ciders.

2. The rearing of a sufficient number of trees, to produce a good vintage.

3. The securing thereby the ripening of the apples, at the same time, and at the proper sea-

4. The separation of the select apples from all unripe ones, and from all acerb varieties.

5. The removal of all dirt and heterogenous

6. Attention to the clean and inodorous condi-

7. Proper attention to the process of fermentation, that it be checked by sulphureous fumes, by by cool vaults before it goes too far.

8. The construction of cellars or recesses along side-hills or slopes, for keeping and ripening the

9. Due attention to fining, racking, decanting, and precaution requisite for rendering it as complete as its nature will admit.

Whenever the state of society shall arrive, and I hope it is not very remote, when the apple shall receive that culture and management of which it is susceptible, there will be produced among ourselves liquors or drinks far superior to the greater part of the imported wines, and approaching, with due care and art, the virtues of the most highly esteemed and fashionable of them all.

I avail myself of this opportunity to congratulate you on the good already done by the members, and the prospect of an enlargement as well as a continuance of their useful labours: and I conclude my communication by a renewed assurance of my good feeling and high regard.
SAMUEL L. MITCHILL.

Extract from Observations on the Domestic Wines of the United States, by the late Dr. RUSH.*

It is to be lamented that the grape is not yet sufficiently cultivated in our country, to afford wine for our citizens; but many excellent substitutes may be made for it, from the native fruits of all the states. If two barrels of cider, fresh from the press, are boiled into one, and afterwards fermented, and kept for two or three years in a dry cellar, it affords a liquer, which, according to the

Carrier pigeons were again employed but with better success, at the siege of Leyden, in 1675 .-The garrison were, by means of the information the enemy, despairing of reducing the place, with dered such essential service, should be maintain-ed at the public expense, and that at their death.

1. What is the best kind of soil, or manure, for ed at the public expense, and that at their death, they should be embalmed and preserved in the town house, as a perpetual token of gratitude.

In the east, the employment of pigeons for the conveyance of letters is still very common; par ticularly in Syria, Arabia, and Egypt. Every ba-shaw has generally a basket full of them sent him broad cast? from the grand seraglio, where they are bred, and in case of any insurrection or other emergency, he is enabled, by letting loose two or more of these extraordinary messengers, to convey intelligence to the government long before it could be possibly obtained by other means.

In Flanders, great encouragement is also given to the training of pigeons; and at Antwerp there is an annual competition of the society of pigeon

fanciers.

d

In England, the use of the carrier pigeons is at present wholly confined to the gentlemen of the fancy, who inherited it from the heroes of Tyburn; with whom it was of old a favourite practice, to let loose a number of pigeons at the moment the fatal cart was drawn away, to notify to distant friends the departure of the unhappy cri- feet each way. It consists of hard wood slats, or minal.

The diligence and speed with which these feathered messengers wing their course is extraordinary. From the instant of the liberation, their flight is directed through the clouds, at an immense height to the place of their destination .for breath, and then they are to be seen common-

IMPROVEMENT IN MAKING CIDER.

ing cider from the pomace will be of use to some lbs. 8 oz-at 10 cents per lb. \$10.05. of your readers, you may insert it in the New England Farmer.

Instead of the hoop formerly in use, a square box is made use of in this improvement. box is in the form of a cube three and an half pieces of timber, three and an half feet long, three inches wide, and one inch thick, which are placed in a perpendicular position, at one fourth of an inch distance from each other.-These slats hard wood, of three inches perpendicular diametached to the front ends of said bolts The hooks seed was gone, she was visibly attered.

This construction renders it easy to take off the front bars and slats, in order to discharge the pomace. Hoops or boxes of this sort, excepting the eye-bolts and nuts, &c. for taking off the front part, are in use in Hingham, (Mass.) and its neighbourhood. This contrivance obviates the necessity of cutting down and new-laying the cheese, &c. for the purpose of extracting the liquor from its sides, according to the old method. I am, Sir, yours, &c.

Dorchester, Sept. 22, 1824. J. MEANS.

IF A model of the machine above described may be seen at the office of the N. E. Farmer.

[BY THE EDITOR.]

In a Treatise on Fruit Trees, by William Coxe Esq. page 77, a box in some degree similar to that above mentioned, is thus described, as in use

in making cider from the crab apple.

"Three pieces of tough white-oak on each side, are connected together by tenons and mortices, so as to form a hollow square of five feet by four in the pigeon free to pursue his course. The garrimile, then two, four, eight, ten, twenty, &c. till son, deprived by his decree of all hopes of relief, at length it will return from the futhermost parts and half an inch thick which stand unright the country. the crib is fixed on the press; the mortices are rivetted with iron bands, and the tenons secured by iron pins three quarters of an inch thick, to resist the pressure of the beam. In this crib no straw is necessary, the pomace being sufficiently fibrous and tough to prevent its passage through the slats, with the severest pressure."

The method described by Mr Means, of de! taching the front part of the box or crib, by means of bolts and nuts, is, we believe, his own invention; and we are of opinion that it will prove a valuable improvement on the original invention.

DEAR SIR,-At the suggestion of some of my friends, who, as well as myself, have occasionally noticed in your valuable paper, several accounts of the weights and ages of different animals, and especially of swine, I have consented to trouble you with a description of one raised on my farm in 1821.

In the year 1821 there was raised on the farm of Mr. Thaddeus Leavitt, in Suffield, (Con) from one sow, three pigs which in the month of May, at seven weeks old, were killed, dressed, and sold, and weighed as follows, viz. the first weighed 28 pounds, 8 ounces—the second 31 lbs 12 oz.—and MR. FESSENDEN,-If you think that the fol- the third 40 lbs. 4 oz -and were all sold at 10 lowing description of an Improved Hoop for press- cents per pound .- Total weight of the three 100

My net gain in fattening these two cattle was more than all I have cleared before in fattening oxen, and cows, have cleared before in fattening oxen, and cows, in 15 years; and this is owing, I think chiefly to the use of flax seed. I never fattened cattle that the use of flax seed. I never fattened cattle that made her passage round Cape Horn in 4 more made her passage of this disease were their fare with somuch natural ease and regularity as these. I would therefore recommend the above preparation to the attention of farmers as proved in fineness, in better condition for market, and is much improved in fineness, in better condition for market, ed. It is this: Take as much kitchen soap as my, one half of your corn may be saved, to produce abundance is the land, and your garners shall overflow with oil and fatness. I shall purimprove it, and I trust I shall be enabled to say, the half has not been told.

Litchfield, (Con.)

Extracts from late numbers of the London Farmers' Journal.

QUERIES ON SALTING HAY. Northamptonshire, June 14, 1823.

Sir,—Having heard of the great advantage of salting hay in the stack, and intending to try it this ensuing season, I should be much obliged to you, or any of your numerous correspondents, who would, through the medium of your valuable Journal, inform me whether the common salt is generally used for that purpose, and the proper quantity per ton, and manner of laying it on; and also of the proper sort of salt to be given to cattle, and the best method of giving it them.

TYRO. I remain, your constant reader,

We have given publicity to this letter in hopes of producing as fine wool as any country, that some of our correspondents will furnish us. You have repeatedly requested your reconstructions. out very good, and was much relished by cattle .-It is true that such hay would serve as a men-merchant to pay five per cent. for selling. Last struum for the salt, and if a little of it were given year we had but one offer for our wool, and refusnow and then (twice or thrice a week,) it would soon be greedily devoured. But it does not fol-sheep, which I sold at 70 cents, washed on the low, nor is it reasonable, that cattle should have sheep. This year from the same sheep, I sold none but salt hay to eat; first, because you do the wool at 45 cents in the dirt; it will waste by Mr. President Levy, who in delivering his none but salt hay to eat; first, because you do the wool at 45 cents in the dirt; it will waste by Mr. President Levy, who in delivering his not know how much salt you give them; and see about 50 per cent, by cleaning; and all my other opinion, expressed himself nearly in these terms. cond, because the salt is an alterative, and ought not to be made an article of daily use. It will waste about 45 per cent. and was from a flock imperious duty. I am called upon as a Judge, to probably pall the appetite, and it is obvious that averaging full 15-16th merino blood; and the wool deliver the prisoner to the claimant, as his masto do good it must become by habit a species of taken last year from the same flock, washed on ter, in order that he may remove to Virginia as condiment, useful to digestion; whereas it is certhe sheep, at 56 cents. My father's lot of 3,000 lb. his slave. I feel the importance of the subject tain that no such matter is constantly wanted.— was all in the dirt, and the flock 1.3 full blood, the under my consideration in every point of view; We are very sensible of the utility of salt for cattle and sheep; but especially in elevated districts, and on cold clay land. It is probable that salt at six month's credit. Wool washed on the sheep, self, and without any expectation of ever holding may occasionally be given with advantage to all 3.4 to 7.8 blood, sells here generally at 42 to 50 one, I am certainly disinterested, and if it were cattle and sheep (especially ewes in lamb, or cents. Our manufacturers have not as yet paid an unsettled question, if, in the language of Lawsuckling,) during the cold spring season. Rock for fine wool as much as they have for course in yers, it were Res Integra, I should probably en-

merchant to pay five per cent. for selling. Last ed selling all, except a small lot from selected would justify him in doing so. wool that was in the dirt at 40 cents, and that will

proportion to the real value. The raisers of wool ought not to be compelled to send their wool from nome, and pay five per cent. for selling, and the manufacturer ought to be willing to encourage the growing of wool by purchasing directly from the farmer. If wool is even sent from the farm, it ought to go into the hands of a stapler, and put into the market well assorted and clean.

Hartford, (Conn.) 1st Sept. 1824.

-0-FOR THE AMERICAN FARMER.

AN EFFECTUAL REMEDY.

In the second volume of the American Farmer, appeared so calm, so hearty, and digested all and five days. She has a full cargo of wool and so fatal among my fowls as to induce me to break a good substitute for corn. I kept my cows on it alone in the month of March for one third the expense of hay. It makes rich milk and excellent butter. Farmers! by a proper attention to econobeen productive.

He is this: Take as much kitchen soap as will cover the thumb nail, and having mixed it alone in the month of March for one third the expense of hay. It makes rich milk and excellent settlements in that quarter, and the crops had butter. Farmers! by a proper attention to econobeen productive. We have just seen a letter from Dawlish, next to impossible that it should fail.

FROM THE DEMOCRATIC PRESS.

September 23, 1824.

This morning the case of Negro George came before the President of the District Court and was decided by him. He had been claimed as the runaway slave of a Mr. John H. Winder, of North-ampton County, Virginia. Two witnesses had sworn on Tuesday last, to their knowledge of his having been in the service of the said Winder, Sir,—I enclose you a few samples of wool from my Saxon and Merino Sheep, and a sample of wool from the skin of a wild sheep, native of N. time to procure witnesses from Chester County to America. This sheep was killed near the Rocky prove his freedom, time was allowed him for that purpose until this morning, the 23d, at half past the New-York Institution, and there remains for nine. He appeared at the time and produced one worms to eat and mice to make nests of. This is witness who had seen and known him in Chester a loose lock taken when the worms had seperated County, but as that witness knew nothing of him it from the pelt; and I think the sight of it will till after the period, at which it had been proved convince any man that North America is capable he had absconded from Northampton County, with real facts and experiments on salting hay: different States, to give you the price of wool of what we know of it from actual observation, and different qualities. I shall probably be the first that does comply with your request. Last week have read of such things as hay being totally spoiled in the rain, and being salted in the stack it came out very wood, and was much reliable to the price of wool of the prisoner, resourced in the rain, and being salted in the stack it came we have always till last year sold it immediately. after shearing; never have sent it to a commission discover further proof in his behalf, pledging himself to give the court no trouble, unless the evidence should be obtained, which in his opinion

AGRICULTURAL EXHIBITION,

The Pennsylvania Agricultural Society will hold their second Cattle Show and Exhibition of Agri :ultural Implements and Products, near Chester, in Delaware county, on the 14th and 15th days of October next, when there will be a most interesting display of fine stock of every description -as well as of new and useful Implements of Husbandry, articles of domestic manufacture, &c. I can scarcely conceive of a more noble spectacle, than to see an assemblage of intelligent and spirit ed farmers, producing together the choicest fruits of their skill and industry-liberally exchanging their opinions, and diffusing the lights of their experience, for the common good. The mere obtaining Premiums offered—however gratifying to successful competitors-is but a secondary consideration in comparison with the benefits to be derived from such exhibitions, when duly improved. It is the information obtained-the new views respecting the character and qualities of Stock-and above all, the facilities which a general display affords, for procuring and diffusing, at a reasonable expense the most desirable breeds of Cattle, and most valuable Implements of Husbandry-as well as a knowledge of the most approved Crops, and modes of tillage: these are the great and truly important objects of the institution In this way, information may be disseminated, by a single exhibition, to an extent which would otherwise have required an age to accomplish.

The sons of farmers too, are invited in an especial manner, on this occasion, to come forth and take hold of the Plough, in a generous spirit of emulation, and exhibit their skill and dexterity in that noble employment. In addition to the Premium held forth exclusively for Farmers and their sons, it is also designed to grant another pre-mium to the best Ploughman who shall enter the lists without restriction, as to the candidates, and free the competition of every man. For this liberal proposition, the public are chiefly indebted to John Hare Powel, Esq. of Philadelphia County, a gentleman whose zeal, public spirit, and indefatigable industry in the cause of agriculture, eminently entitle him to the thanks and admira-

tion of the farmers of Pennsylvania.

THE FARMER.

BALTIMORE, FRIDAY, OCTOBER 8, 1824.

The prospectus of Messrs. Gales & Seaton, published in this number of the Farmer, speaks for itself, and we need not dwell upon the great convenience and utility of having a faithful "RE GISTER OF DEBATES IN CONGRESS" with the Yeas and Nays on all questions. The great experience and well known abilities of the Editors ive assurance that the undertaking will be well executed; and we shall be happy to take, at the Office of the American Farmer, the names of all who may be disposed to subscribe.

We avail ourselves of the latitude given by our obliging "Correspondent on a visit at Sarato-go," to lay over his letter touching the cost, revenue, advantages, &c. of the New-York Canal, as well as other letters received for him, but shall embrace the first opportunity to present them to our readers.

SILAS HARLAN, Esq. of Kentucky, will deliver six or eight Elks, male and female, in the State of Maryland before Christmas next, under a responsible engagement to pay him one hundred dollars for each. Persons desiring to purchase may enquire of W. F. Redding, Esq. Office of American Farmer, Baltimore.

It will be remembered that the days fixed for the next Maryland Cattle Show to be held at the Maryland Tavern, on the Frederick road, four miles from Baltimore, are Monday, Tues-day, and Wednesday, the 25th, 26th, and 27th of duck bill

this month, (October.)

At said Show there will be premiums distributed consisting of various pieces of Silver Plate, amounting to \$1040. As follows:-For best cultivated and most profitable farms \$100 Dutch or left hand Plough for 2 horses Crops of various kinds 235 Horses of different kinds and ages 129

AGRICULTURE.

ON SHEEP.

[The readers of the Farmer have already been apprised that the Editor bears in mind the growing importance of SHEEP HUSBANDRY, to a large portion of the American Farmer, and that he will of all accessible sources of information, to impart to his subscribers the most correct views of this interesting subject. In pursuance of this inten-tion it seems best in the first instance to speak of the various breeds of Sheep and their general properties, descending hereafter to more particular descriptions and more minute details, as to the various qualities of wool and the best modes of preserving those qualities, and the preparation of the article for sale or family manufacture; together with reflections on what is necessary to establish a better and more permanent market. To these must be added minute directions as to breeding, feeding, management, &c. of Rams, Wethers, Ewes in lamb, young lambs, &c. &c. As an entering wedge in the prosecution of the design here briefly described, we are glad to have it in our power to present a valuable paper from the pen of a gentleman so thoroughly acquainted with all the points and properties of domestic animals, as J. H. Power, Corresponding Secretary of the Pennsylvania Agricultural Society.

The communication which follows, is taken

from a work just published by the Editor of the have been brought, within fifteen or twenty years but their chests are sufficiently wide to afford American Farmer, entitled, "Memoirs of the Pennsylvania Agricultural Society, with selections land, to this and the neighbouring states. The the healthful action of which, all scientific and from the most approved authors, adapted to the use of the Practical Farmers of the United States;" for which he has found it necessary to secure the copy right, on account of the great cost of printing and publishing the book. The price of the volume will be two dollars: about 300 pages, and

numerous copper-plate engravings.]

Edit. Am. Farmer.

ON VARIOUS BREEDS OF SHEEP-their Origin, Peculiarities, and Properties.

By JOHN HARE POWEL, ESQ. Powelton, Philadelphia Co. 1824.

Dear Sir,—The importance of Sheep husband-ry will not be questioned in a country, whose boundless forests have not been subdued, yet whose wants are so various, that foreign beef, and unmanufactured European wool, are consumed, whilst neither trade, nor manufactures, regularly meet the ruinous drafts to which improvidence, or ignorance has brought her to submit. The rage of speculation, which the nature of our institutions, not less than the circumstances of the country, cannot fail to beget, has been manifested, alike in our agricultural pursuits, and our commercial career. It is scarcely to be believed, that men, remarkable as we flatter ourselves, for sagacity, could have been brought to so wildly em. bark, in the adventurous scheme, of manufacturled to abandon the object, which they had so ard to obviate, dently sought, condemning to the knife of the herd's hand. butcher, myriads of the extraordinary race, which alone, it had been contended, could rescue us from national degradation and want. The great mistake, into which our speculative farmers were profitable, but from the deduction, by figures, that themselves and their farms could be successfully devoted to the propagation and management of sheep alone.

be determined only, by the position, and circum-stances, wherein it is placed. A due quantity of sheep, in most situations, is found the source of great profit to the husbandman, whilst they afford, the means of ultimate improvement to the land, Their based is a matter of socious consideration. Their breed, is a matter of serious consideration, tail, which however delicate to the palate of a and in some countries of Europe, distinguished by Turk, is not likely to become fashionable in good policy, it is considered so important, that it America, and therefore, cannot be more profitable, embrace every suitable occasion and avail himself has been made a subject of legislation, to guard by than any other augmentation of offal, as it would the severest penalties, against the exportation of be, to seek the enlargement of bone.

any individual of this valuable race.

The weight of its carcass, may fairly be stated at usually eaten by the more wealthy classes of from thirty-five to forty pounds. The bad quality of the mutton, or its ill appearance upon the stall, or possibly some prejudice, existing against it in this country, as in Spain, whence the animal was brought, makes it less valuable for the shambles, less loaded with fat, showing more proof within the most common than hard more the worst of finer texture and better down, Dishley and Teeswater sheep, carried by secretions of the animal, must depend. and Dishley sheep, taken in a prize to N. York—their vigour and activity, are enabled to find the Texel sheep imported by Col. Perkins of Bos-support, and to thrive upon bleak and barren hills ton—and the admirable Tunisian mountain sheep where Dishley sheep would die from exposure, for which Pennsylvania is indebted to the liberali- or would starve. ty of Col. Pickering, "who having received them The various flocks called Bakewell, in New this country, I have ever seen. The praise, which by their fleece and peculiarities of form.

individual of this valuable race.

Dishley sheep, are remarkable for arriving have always considered, that the introduction early at maturity, for consuming less food—laying of Merinoes was fortunate, merely, as it gave the on more fat—affording more weight, with less means of crossing various breeds of our native, offal, than any family of sheep known. They and imported sheep; not in affording, the material for clothes, fitted but for the rich, and crooked ill flavoured little carcasses, disdained even by the poor. The average weight of the fleeces, produced by the best Merino flocks, when made perdage, that in this country, where pork supplies factly clean seldom exceeds two and an half the place, which gross mutton finds in England. feetly clean, seldom exceeds two and an half the place, which gross mutton finds in England, pounds per head, which at fifty cents per pound, pure Dishley sheep never can, I apprehend, be would equal, but one dollar twenty-five cents each. generally introduced. In England they are not

than the most common sheep, bred upon the worst affording mutton of finer texture, and better managed farms If the market afford a test, by flavour, than any breed known. Their form is which its value can be shown, it may be stated, not so accurate, their fore-quarters being lighter, that no mutton is so little sought. Several sheep their necks longer than those of Dishley sheep : most valuable which I have traced, are the South- practical men agree, the vigour, and useful Captain Beanes to New-Jersey-those brought to are much more hardy, have not much more Pennsylvania by Captain Jeffreys-a male and an offal; they consume rather more food, in proporewe imported by Mr. Waln-some Teeswater, tion to their size, than Dishley sheep, but by

in a national ship" caused them to be distributed Jersey, Delaware, and Pennsylvania, are derived in this state, in preference to his own. I know no from Beane's importation of Dishley, Southdown instance, of improvidence, or want of judgment, and Teeswater, mixed in some instances with more glaring among Pennsylvania farmers, than Merino, native, and Jeffrey's breeds. Some inhas been evinced, in their neglect of one of the most dividuals, are strongly marked, not only by the useful and most hardy families of sheep, which in speckled or smutty faces of the Southdown, but has been bestowed upon them, by a zealous, and one excellence of the mutton, would be cited to prove of the earliest and most distinguished promoters of that my opinions of the "English Bakewell" agricultural science in America, my experience sheep must be incorrect, if it were not underhas satisfied me, is just. They arrive early at stood, that the texture, and quality of the mutton, maturity, carry good fleeces, afford delicate muthave been exceedingly improved by the Southton, lay their fat well within, and except the down, or native cross-although the value of the Dishley and Southdown breeds, are more easily fleece, and excellence in form, have certainly kept, than any sheep I can find. I conceive that extraordinary jection to them, is the obstruction, opposed to size is not to be desired in any domestic animal, procreation by the unwieldly excrescence adhe-unless it be obtained without extraordinary ring to their tails. If an ewe, lose her lamb early labour, or food. The great object to be sought in the season, the chance of impregnation is very by all breeders, whether of neat cattle or sheep, bark, in the adventurous scheme, of manufactur-ing cloths for themselves, and raising wool for the European world, as to give fifteen years since, a thousand dollars for a sheep, and now have been led to abandon the object, which they had so arand afterwards watched, and most carefully I have obtained I believe, the remnant of the nursed both by night and by day at the season of best flock, which could at any time have been yeaning, with all the attention which the low found in this state. I have crossed them with price of labour, and high price of land only can Beane's mixed Dishley and Southdown stock. I justify, I should recommend thorough bred Dishled, arose not from the belief, that sheep were hope to obtain the hardiness, and fine mutton of ley sheep. But whilst our attention must be profitable, but from the deduction, by figures, Tunisian sheep, with the better form, smaller chiefly directed to the propagation of stock, bone, wider chests, longer fleece, early maturity which can be bred and reared, in those districts and singular tendency towards fat, of some of of our country, where by the labour of a few days, the best individuals of the other family, without a man may become possessed in fee of an acre of The proportions, which the different kinds of the useless incumbrance of an heavy and broad land, it would be absurd, to introduce a family of stock, should bear to each other upon a farm, can tail. Without attempting to decide, in favour of animals, which require as much nursing and care,

Vol. 6.-30.

AGRICULTURAL EXHIBITION,

The Pennsylvania Agricultural Society will hold their second Cattle Show and Exhibition of Agri cultural Implements and Products, near Chester, in Delaware county, on the 14th and 15th days of October next, when there will be a most interesting display of fine stock of every description -as well as of new and useful Implements of Husbandry, articles of domestic manufacture, &c. I can scarcely conceive of a more noble spectacle, than to see an assemblage of intelligent and spirit ed farmers, producing together the choicest fruits of their skill and industry-liberally exchanging their opinions, and diffusing the lights of their ex-perience, for the common good. The mere ob-taining *Premiums* offered—however gratifying to successful competitors-is but a secondary consideration in comparison with the benefits to be derived from such exhibitions, when duly improved. It is the information obtained-the new views respecting the character and qualities of Stock-and above all, the facilities which a general display affords, for procuring and diffusing, at a reasonable expense the most desirable breeds of Cattle, and most valuable Implements of Husbandry-as well as a knowledge of the most approved Crops, and modes of tillage; these are the great and truly important objects of the institution. In this way, information may be disseminated, by a single exhibition, to an extent which would otherwise have required an age to accomplish.

The sons of farmers too, are invited in an especial manner, on this occasion, to come forth and take hold of the Plough, in a generous spirit of emulation, and exhibit their skill and dexterity in that noble employment. In addition to the Pre-mium held forth exclusively for Farmers and their sons, it is also designed to grant another pre-mium to the best Ploughman who shall enter the lists without restriction, as to the candidates, and free the competition of every man. For this liberal proposition, the public are chiefly indebted to John Hare Powel, Esq. of Philadelphia County, a gentleman whose zeal, public spirit, and indefatigable industry in the cause of agriculture, eminently entitle him to the thanks and admira-

tion of the farmers of Pennsylvania. A Chester County Farmer.

-0-AMERICAN CANALS.

Three hundred and thirty miles of the New-York Grand Canal will be navigable this fall: and the Agricultural Society of Maryland will bring tablishing an uninterrupted intercourse between to the Show whatever may be at all extraordina-

cessful.

The Canal between Philadelphia and Baltimore will probably be opened next year; and the Chesapeake and Ohio Canal commenced. When this is made, an inland voyage between Norfolk, Baltimore, &c. &c. and New-Orleans, can be effected.

We hope soon to hear of spirited measures for making the Canal from the Atlantic to the Pacific, through a part of the Colombian Republic. this Great Republic prospers, as we trust it will, the important work will be achieved.

Boston Palladium.

ERRATA .- I observe you have published my notice of the Hereford Bull and Heifer-in it you say I take Calves at heir REAL value, it should be VEAL value.

THE FARMER.

BALTIMORE, FRIDAY, OCTOBER 8, 1824.

The prospectus of Messrs. Gales & Seaton, published in this number of the Farmer, speaks for itself, and we need not dwell upon the great convenience and utility of having a faithful "RE GISTER OF DEBATES IN CONGRESS" with the Yeas and Nays on all questions. The great experience and well known abilities of the Editors ive assurance that the undertaking will be well executed; and we shall be happy to take, at the Office of the American Farmer, the names of all who may be disposed to subscribe.

We avail ourselves of the latitude given by our obliging "Correspondent on a visit at Saratogo," to lay over his letter touching the cost, revenue, advantages, &c. of the New-York Canal, as well as other letters received for him, but shall embrace the first opportunity to present them to our readers.

SILAS HARLAN, Esq. of Kentucky, will deliver six or eight Elks, male and female, in the State of Maryland before Christmas next, under a responsible engagement to pay him one hundred American Farmer, Baltimore.

It will be remembered that the days fixed for the next Maryland Cattle Show to be held at the Maryland Tavern, on the Frederick road, four miles from Baltimore, are Monday, Tues-day, and Wednesday, the 25th, 26th, and 27th of

this month, (October.)

At said Show there will be premiums distributed consisting of various pieces of Silver Plate, amounting to \$1040. As follows:-

For best cultivated and most profitable farms \$100 Crops of various kinds Horses of different kinds and ages 129 Asses and Mules 35 Neat Cattle . 188 Sheep 40 Swine 30 Ploughing . 59 46 Implements of Husbandry . 18 Cider . 2

IF It is earnestly hoped that every friend of the city of New-York and Lake Superior.

The success of the Grand Canal will cause many other Canals to be made, and to be sucment. Live Stock of any kind may be exhibited, be supplied with all the iron work, at the lowest either for premium or to gratify the publick, and price. Stock of every kind may be sold on the ground, either privately or by an auctioneer at the ex-pense of the Society. It will be a good market for those who have for sale fine Horses, Hogs,

turns at 2, P. M. of same day.

PRICES OF COUNTRY PRODUCE - carefully collected every Thursday, for the American Farmer. By ROGERS & STMINGTON.

Flour, Howard-St., \$5 37\frac{1}{2} a \$5 50—do wharf, \$5—Wheat, red, \$1—Lawler, do \$1 a \$1 05 best white, \$1 08 a 1 12\frac{1}{2}\to Corn, white, 35 cts.— Yellow, do 38 cents—Rye, 37\frac{1}{2}\to cents—Oats, 22 a 25 cents-Whiskey, 26 a 28 cents-Clover Seed, white, per lb. 37½ cts.—Red, do per bushel, \$4.75—Saplin, do \$5.75—Timothy, 3—Orchard grass, \$2 50—Herds grass, 2—Herrings, No. 1, \$2 25— No. 2, \$2—Hay, per ton, \$10—Leather, best Sole,24 to 27 cts.—Feathers, live, per lb. 30 a 35— Cotton, Louisiana, 16 to 18 cts.-Georgia, Upland, 15 to 17 cts.-Alabama, 13 to 15-New Wool, 30 to 35 cts.-Merino full blooded 35 to 40 cts.- do 30 to 35 cts.- do 25 to 28 cts.-Common, 20 to 25 cts.-25 per cent, more when well washed on the sheep and free from tags—Coal, pit, foreign, 40 cts.—Virginia, do. 20 to 25—Susquehannah, do 6 50 to \$7-Lime, bushel, 30 to 33 cents. TOBACCO .- No sales since our last report.

To Farmers.

CHARLES B. PALMER, No. 41, LIGHT-ST. BALTIMORE, 7 DOORS FROM PRATT-ST.

Respectfully informs the public he has on hand PLOUGHS and AGRICULTURAL IMPLEdollars for each. Persons desiring to purchase PLOUGHS and AGRICULTURAL IMPLEmay enquire of W. F. Redding, Esq. Office of MEN IS of various kinds, which are warranted to run well and made in the best manner, and for the convenience of persons at a distance (to order) he has thought proper to affix his prices. Persons disposed to purchase, will please call and examine for themselves.

Pennsylvania Bar Shares for seeding duck bill \$5 50 do. do. Coltered Do. 6 50 Do. do. do. 2 horse \$74 to 11 00 do. do. 3 do. 12 to 14 00 Patent 2 horse self-sharpening Plough 10 00 Dutch or left hand Plough for 2 horses A few of Freeborn or N. York Ploughs, 10 00 will be sold low for cash, 1, 2, 3, and 4 horse, some for oxen 7 to 9 00 Wood's cast iron Ploughs of Philadelphia 5 to 9 00 Yankee or Conn't. Plough, No. 1 4 75 Do. do. do. No. 2 5 25 No. 3 Do. do. do. 5 75 110 Cutting Boxes with treddles \$8, without treddles 5 00 Wheat fans of the old kind \$18, shaking screen 25 00 A concave corn sheller for 12 00

Which will shell as fast as one person can feed it will be opened into Lake Erie next year: es- himself, and encourage his neighbours to bring it; a person purchasing one and not liking it may return it, if uninjured, and the money refunded.

5

All repairs done immediately.
CHARLES B. PALMER.

AGRICULTURE.

ON SHEEP.

[The readers of the Farmer have already been apprised that the Editor bears in mind the growing importance of SHEEP HUSBANDRY, to a large portion of the American Farmer, and that he will embrace every suitable occasion and avail himself of all accessible sources of information, to impart to his subscribers the most correct views of this interesting subject. In pursuance of this inten-tion it seems best in the first instance to speak of the various breeds of Sheep and their general properties, descending hereafter to more particular descriptions and more minute details, as to the various qualities of wool and the best modes of preserving those qualities, and the preparation of the article for sale or family manufacture; together with reflections on what is necessary to establish a better and more permanent market. To these must be added minute directions as to breeding, feeding, management, &c. of Rams, Wethers, Ewes in lamb, young lambs, &c. &c. As an entering wedge in the prosecution of the design here briefly described, we are glad to have it in our power to present a valuable paper from the pen of a gentleman so thoroughly acquainted with all the points and properties of domestic animals, as J. H. Power, Corresponding Secretary of the Pennsylvania Agricultural Society.

from the most approved authors, adapted to the use of the Practical Farmers of the United States;" down, Dishley and Teeswater sheep, carried by secretions of the animal, must depend. They capt right, on account of the great cost of print. from the most approved authors, adapted to the copy right, on account of the great cost of printing and publishing the book. The price of the volume will be two dollars: about 300 pages, and numerous copper-plate engravings.]

Edit. Am. Farmer.

ON VARIOUS BREEDS OF SHEEP-their Origin, Peculiarities, and Properties.

By JOHN HARE POWEL, Esq.

Powelton, Philadelphia Co. 1824. Dear Sir,-The importance of Sheep husbandry will not be questioned in a country, whose boundless forests have not been subdued, yet whose wants are so various, that foreign beef, and unmanufactured European wool, are consumed, whilst neither trade, nor manufactures, regularly men, remarkable as we flatter ourselves, for sagacity, could have been brought to so wildly em. butcher, myriads of the extraordinary race, which

Their breed, is a matter of serious consideration, tail, which however delicate to the palate of a and in some countries of Europe, distinguished by Turk, is not likely to become fashionable in good policy, it is considered so important, that it America, and therefore, cannot be more profitable, has been made a subject of legislation, to guard by than any other augmentation of offal, as it would the severest penalties, against the exportation of be, to seek the enlargement of bone.

any individual of this valuable race. of Merinoes was fortunate, merely, as it gave the materians of crossing various breeds of our native, offal, than any family of sheep known. They and imported sheep; not in affording, the material for clothes, fitted but for the rich, and crooked ill flavoured little carcasses, disdained even by the offal, the Southdown, and some other breeds. Their poor. The average weight of the fleeces, pro-duced by the best Merino flocks, when made per-fectly clean, seldom exceeds two and an half pounds per head, which at fifty cents per pound, pounds per head, which at fifty cents per pound, pure Dishley sheep never can, I apprehend, be would equal, but one dollar twenty-five cents each. The weight of its carcass, may fairly be stated at usually eaten by the more wealthy classes of from thirty-five to forty pounds. The bad quality of the mutton, or its ill appearance upon the stall, or possibly some prejudice, existing against it in this country, as in Spain, whence the animal was brought, makes it less valuable for the shambles, less loaded with fat, showing more proof within, then the most common them, bred upon the worst affording mutton of finer texture, and better managed farms If the market afford a test, by flavour, than any breed known. Their form is which its value can be shown, it may be stated, not so accurate, their fore-quarters being lighter, that no mutton is so little sought. Several sheep their necks longer than those of Dishley sheep: which its value can be shown, it may be stated, not so accurate, their fore-quarters being lighter, that no mutton is so little sought. Several sheep their necks longer than those of Dishley sheep: have been brought, within fifteen or twenty years but their chests are sufficiently wide to afford American Farmer, entitled, "Memoirs of the from Great Britain, Ireland, Germany, and Holample space for the position of their lungs; upon ewe imported by Mr. Waln—some Teeswater, tion to their size, than Dishley sheep, but by and Dishley sheep, taken in a prize to N. York—their vigour and activity, are enabled to find the Texel sheep imported by Col. Perkins of Bossupport, and to thrive upon bleak and barren hills ton—and the admirable Tunisian mountain sheep where Dishley sheep would die from exposure, for which Pennsylvania is indebted to the liberality or would starve. this country, I have ever seen. The praise, which by their fleece and peculiarities of form. of the earliest and most distinguished promoters of that my opinions of the "English Bakewell" meet the ruinous drafts to which improvidence, or ignorance has brought her to submit. The rage of speculation, which the nature of our institutions, not less than the circumstances of the country, cannot fail to beget, has been manifested, alike in our agricultural pursuits, and our commercial career. It is scarcely to be believed, that her obstruction by the unwieldly excrescence adherences in that my opinions of the "English Bakewell" agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not understanting agricultural science in America, my experience sheep must be incorrect, if it were not un procreation by the unwieldly excrescence adhe-unless it be obtained without extraordinary ring to their tails. If an ewe, lose her lamb early labour, or food. The great object to be sought

alone, it had been contended, could rescue us from national degradation and want. The great found in this state. I have crossed them with price of labour, and high price of land only can mistake, into which our speculative farmers were Beane's mixed Dishley and Southdown stock. I justify, I should recommend thorough bred Dishley and Southdown stock. led, arose not from the belief, that sheep were hope to obtain the hardiness, and fine mutton of ley sheep. But whilst our attention must be profitable, but from the deduction, by figures, that themselves and their farms could be success-bone, wider chests, longer fleece, early maturity which can be bred and reared, in those districts fully devoted to the propagation and management of sheep alone.

The proportions, which the different kinds of stock, should bear to each other upon a farm, can vol. 6.—30.

stances, wherein it is placed. A due quantity of sheep, in most situations, is found the source of great profit to the husbandman, whilst they afford, the means of ultimate improvement to the land.

y individual of this valuable race.

Dishley sheep, are remarkable for arriving have always considered, that the introduction early at maturity, for consuming less food—laying

than the most common sheep, bred upon the worst affording mutton of finer texture, and better land, to this and the neighbouring states. The the healthful action of which, all scientific and

ty of Col. Pickering, "who having received them The various flocks called Bakewell, in New in a national ship" caused them to be distributed Jersey, Delaware, and Pennsylvania, are derived in this state, in preference to his own. I know no from Beane's importation of Dishley, Southdown instance, of improvidence, or want of judgment, and Teeswater, mixed in some instances with more glaring among Pennsylvania farmers, than Merino, native, and Jeffrey's breeds. Some inhas been evinced, in their neglect of one of the most dividuals, are strongly marked, not only by the useful and most hardy families of sheep, which in speckled or smutty faces of the Southdown, but has been bestowed upon them, by a zealous, and one excellence of the mutton, would be cited to prove bark, in the adventurous scheme, of manufacturing least object to be sought in the season, the chance of impregnation is very by all breeders, whether of neat cattle or sheep, ing cloths for themselves, and raising wool for the European world, as to give fifteen years since, a thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand dollars for a sheep, and now have been thousand the sheep that the led to abandon the object, which they had so ar-to obviate, even by the assistance of the shep-dently sought, condemning to the knife of the herd's hand. I have obtained I believe, the remnant of the nursed both by night and by day at the season of

too short, the bone too fine, the constitution ten- of attracting carbonic acid, are always saturated flock. A successful grazier of Delaware has of the use of nitre, and of nitrous salts in vegetashown his sagacity, by crossing with Jeffrey's and other sheep. He has gained size, and weight of fleece. Mr. Case, and Mr. Exton, of New fallows. Nitrous salts are produced during the Jersey, are perhaps, among the most judicious exposure of soils containing animal and vegetable breeders of the middle states-so far as I am remains, and in greatest abundance in hot weather : enabled to judge, through the efforts which have but it is probably by the combination of azote, been made by rival breeders, to obtain individuals escaping from those remains, with oxygen in the from their flocks, sprung from the best blood introduced by Captain Beanes. I have a few sheep expense of an element which would otherwise bred by them, which confirm my impressions, have been converted into ammonia; the comany thing comparable to the animals upon Mr. under VIII. 2, are much more efficacious than the Case's farm, or those derived by Mr. Clement nitrous compounds in assisting vegetation "*
directly from their blood. I purchased all the (3dly.) "When weeds are buried in the soil, directly from their blood. I purchased all the sheep exhibited by Mr. Case at the late show, from some of the best ewes, which Mr. Clement had possessed. One of the wethers of two years, which had been fed only upon hay and grass, time the vegetable clothing the star factoring from its birth, was killed in December, after floughed in Carbonic acid gas is formed during from its birth, was killed in December, among my the whole time by the action of the vegetable matter. store sheep, as it was my intention to keep him another year. Mr. Wunder, the butcher who hart of it is lost to the soil in which it was formed, killed him, paid for 1081 pounds, the weight of and dissipated in the atmosphere. his quarters. He had great proof, an ample fleece, and bone of proper size. If any credit is soil tends to disengage the gaseous and the volatile to be ascribed, it belongs to Mr. Wonderly, who fluid matters contained in it; and heat increases bred him, and to Mr. Clement, who bred the ram the rapidity of fermentation: and in the summer which begat him.

I am, with great respect, yours, &c.
JOHN HARE POWEL.

President of the Penn. Agri. So.

TREATISE ON SOILS AND MANURES BY A PRACTICAL AGRICULTURIST."

(Continued from our last.)

V. By Fallowing .- Sir Humphry Davy seems to under rate the utility of fallowing, and to be disposed to recommend the non-fallowing system.

The following is the substance of the observations occurring in different parts of his work on this subject. (1st.) "The chemical theory of fallowing is very simple. Fallowing affords no new source of riches to the soil. It merely tends fallowing, as part of a general system of husbandto produce an accumulation of decomposing matter, which in the common course of crops would be employed as it is formed; and it is scarcely possible to imagine a single instance in which a cultivated soil can lie fallow for an entire year with advantage to the farmer. The only cases where this practice is beneficial seems to be in the destruction of weeds, and for cleansing foul soils.*

"The benefits arising from fallows have been much overrated. A summer fallow, or a clean fallow, may be sometimes necessary in lands overgrown with weeds, particularly if they are sands, which cannot be pared and burnt with advantage but it is certainly unprofitable as part of a general system of husbandry."+

* Blements of Agricultural Chemistry, p. 22.

as the hardy settlers in the forests of America generally devote to the young of their own race. I am therefore endeavouring, to "breed out" the Dishley blood, to obtain the Southdown, in as much purity as possible, from the mixed race. Most of our sheep breeders, have fallen into a common mistake, in following what is supposed to have been the practice of Mr. Bakewell, whose secret has never been divulged. By "breeding combined with more oxygen; none of them will course of crops?"

(2dly.) "It has been supposed by some writers, of crops to employ the decomposing matter as it that certain principles necessary to fertility are its formed,—how are plants which depend still more on the nutriment lodged in the soil, to be grown in full crops, where the quantity of manure is limited by local circumstances, unless the elements of vegetation are allowed to accumulate for ments of vegetation secret has never been divulged. By "breeding combined with more oxygen; none of them will in, and in," they have made the frame and legs unite to azote; and such of them as are capable

> by their gradual decomposition they furnish a cerdoubted, whether there is as much useful manure ter upon the oxygen of the air; and the greater

"The action of the sun upon the surface of the soil tends to disengage the gaseous and the volatile fallow, nutriment is rapidly produced at a time time the vegetables clothing the surface were first when no vegetables are present capable of absorb-ploughed in."... &c. &c. ing it."+

(4thly.) "Land when it is not employed in preparing food for animals, should be applied to the preparation of manure for plants; and this is effected by means of green crops, in consequence of in the shape of vapour, and been dispersed in the the absorption of carbonaceous matter from the atmosphere. It may be worth while to inquire carbonic acid of the atmosphere. In a summer's how far this is to be estimated as a loss? fallow, a period is always lost in which vegetables nourishment for the next crop; and the texture and to mix its different parts together."\$

The reader has now before him the arguments directed by Sir H. Davy against the practice of by communication with the air.

But cannot some of the above objections to the giving of a periodical rest to land after an exhausting crop be obviated? and are not the benefits of a summer fallow, when admitted to be ne-

cessary, in some respects undervalued?

In the first place, this eminent philosopher observes, that fallowing "merely tends to produce an accumulation of decomposing matter, which in the common course of crops would be employ-ed as it is formed." But this accumulation of decomposing matter is alone a great acquisition; it is in many cases the precise restorative wanted to from the air. keep up the proportion of vegetable mould necessary to fertility. Supposing the milder course

course of crops?

Secondly, in opposition to the idea that certain principles necessary to fertility are derived from der, and the fleece unusually light, in the vain with it on those soils on which the practice of the atmosphere, Sir Humphry enters on a specuattempt to regain the excellence of the original fallowing is adopted. The vague ancient opinion lative train of reasoning,—against which it would be presumptuous to appeal, had he offered a positive conclusion as a great chemical authority: but some of the assumed data-such as that the "earths commonly found in soils cannot be combined with more oxygen"—seem to skirmish with the conclusion ["Nitrous salts"... to the end of the paragraph;]—nor has the "vague ancient opinion of the use of nitre and of nitrous salts in vegetation" been subverted or discountenanced by the experiments of modern physiologists, many of whom have found that plants will grow in nitre and I never recollect to have seen in America, pounds of which, as is evident from what is stated alone, which is more than the ancient opinion requires in its support. And as to the final inference,-"but it is probably by the combination," &c. the uncertainty disclosed in the word "pro-bably," deprives the argument of all decisive efand from Mr. Wonderly his whole flock, bred tain quantity of soluble matter: but it may be fect in a practical point of view; for although the Professor is acquainted with the operation of gases in the land at the end of a clean fallow, as at the as far perhaps as experiment will ever trace it. the manner in which nitrous salts are produced in soils containing animal and vegetable remains, is but guessed at by him, and not explained to us with the authority of certain knowledge.

Thirdly, this distinguished Chemist, after virtually admitting, that the weeds which were overrunning the land must enrich it by being buried in its bosom, further observes:-" But it may be doubted, whether there is as much useful manure : in the land at the end of a clean fallow, as at the

To this speculative objection the answer must necessarily take a speculative turn.

If there be less manure in the land at the close of a fallow, the quantity lost must have escaped

In opposition to the theory of Sir Humphry may be raised, either as food for animals, or as Davy on this point, it is quite consistent with good logic to suppose, that whatever escapes from the of the soil is not so much improved by its expo-dissolving mass of a dead plant in the form of sure as in winter, when the expansive powers of vapour, and does not fall down to the earth by ice, the gradual dissolution of snows, and the al- condensation, is easily and most naturally taken ternations from wet to dry, tend to pulverize it, up by a new growing plant from the atmosphere, through the leaves; that is to say, whatever has a tendency to fly off into the air is to be recovered

> On this subject the theory of the author of these remarks is as follows:-

To form the bulk of a growing plant,-certain substances comprehended under some of the descriptions of matter common to vegetables, and which appear on analysis to be combined differently in different species, are taken up by the roots from the soil, and by the leaves from the air, through the medium of congenial fluids; in succulent plants a greater proportion of food is received by the leaves than by the roots, so that even the bulk of the plant, or the basis of the sap, is in such kinds increased chiefly by derivations

To imbue a common insipid basis with those distinguishing peculiarities which make different species growing in the same soil differ in scent, flavour, and the qualities which are salutary or peraicious in food and medicine,—certain specific

Hence in mixed masses of manure, the manure may be considered better adapted for general purposes, when the volatile properties peculiar to merely to disembarrass the practical manager, specific plants and to animal bodies have escaped, that so much has been said by way of theory and when the residuum is nothing more than the matter common to vegetable and animal bodies.

over an immeasurable region of air, and carried culture. by winds over the face of the earth, instead of Some of which the air is constituted-oxygen, azote, and carbonic acid gas-though differing in their specific gravity or rather levity, are found to be quite reasonable to suppose, that the volatile salts at the end of such a fallow than it was before.'ever the atmosphere by the same law. The quantity of volatile essence floating within reach of the attraction of an individual plant must, indeed, be allowed to be evanescent even to the confines of nothingness, when the transparency of the air is considered, and the multiplicity of different essences of which infinitely small divisions are supposed to be floating in it. But if, on the other hand, we advert to the elastic nature of the air, and the property which it is found to have of always preserving its natural equilibrium, the most scanty provisions of volatile food in the vicinity of a plant is abundance. Thus, suppose a plant to take up carbonic acid gas with great avidity; although the proportion of carbonic acid gas is extremely small, yet the plant cannot drink up the quantity in immediate contact so fast, but the same quantity will be constantly preserved in the air surrounding it; for gas of the same nature is incessantly pressing into the temporary void where the interchange of natural air is unrestricted.— The supply of a peculiar essence to plants, by the medium of the common air, may be rendered sufficiently ample by obedience to the same law.

It may therefore be one of the benefits of a fallow, to lose every thing which can escape by a

On the hypothesis which has just been sketched, the objection of Sir H. Davy, that "the action of the sun upon the surface of the soil tends to By a rotation of crops, every ingredient in the disengage the gaseous and the volatile fluid matter that it contains, and heat increases the rapidity of fermentation,"—may be enlisted among the crop remain as nourishment for another. arguments in favour of a summer fallow. To return to the question of fallowing. It is sence, escaping into the atmosphere, is dispersed ment to be safely adopted in this branch of agri-

Some of the incidental statements, in the above being retained for the enrichment of a particular abstract from the Professor's Lectures, are deci-To this it may be answered, that the gases dedly adverse to practical maxims in which most farmers, and the majority of writers on husbandry, including the Reports from Agricultural Sospecific gravity or rather levity, are found to be cieties, concur;—the statements, for example, combined in any cubical quantity of air in a prothat 'sands are benefited by a summer fallow portion which never materially varies;† and it is more than clays;' and that the 'land is not richer or spirits, or atomatic principles, which constitute On the contrary, the conclusion to which the registered courses of profitable husbandry lead, is very much like the following summary.

> 1. Land is uniformly recruited during a fallow this is proved by the circumstance, that, in all soils, a much less quantity of dung is necessary after a summer fallow: and on some lands none is wanted; nay, the experienced Cally is of opinion, that dunging naked fallows is in many cases better dispensed with, and has often, in tolerable

leams, made the crop to fail.

2. Clays are unfit for green crops, the substitute for a summer fallow; and hence are necessitated to adopt the latter, in rotation with white crops.* A winter fallow merely is, indeed, an excellent ried to the fold-yard, for the object of converting thing in light grounds, and as a preparation for the haulm into manure. spring wheat; but it will not do with clays, which "So the best mode require a thorough drying and pulverizing, before they can profit by the falling juices, which would only render the earth more hard and compact. A ing the entire crop for hay is very unprofitable.

3. Light soils only can dispense with fallows. The question therefore is narrowed to this compass: Whether the benefit of a summer fallow, on a sandy or other light soil fit for green crops, is equal to the loss of a year's rent, or to the diffree exposure of the putrefying remains which promiscuously accumulate in a soil. the rent for one year paid on a naked fallow?— The general conclusion is,—that it is not; and

Benefit of Green Crops .- " The introduction of from being colourless or minutely divided, are with manure, but not cleaning of root-weeds to Turnips and Clover has been the means of rentaken up entirely by the leaves from the air; the the full depth of the soil. Plants which quickly dering productive those inferior soils which it was Turnips and Clover has been the means of rencharacter of the plant having been originally fix decompose, such as the lettuce, are most conduit impossible to cultivate under the old system of successive corn crops. Even on land of a better in the seed so as to attract to it only volatile parfibrous woody remains as well as enriching the land. This subject has been already touched unmuch more abundant, that it is probable as many bushels of corn now grow on the half of a given extent of ground as were formerly raised on the whole. In this view alone, almost the whole value of the turnips and clover may be said to be a clear against an hypothesis on non-fallowing, which is gain. Fallow has been banished from all dry soils made to depend on assumptions from chemical by turnips; and where land is laid down to pasgain. Fallow has been banished from all dry soils It may seem to be a loss, that the gaseous es principles too little capable of proof from experi-ture, one acre of clover and rye-grass will fatten more cattle than could barely exist on ten acres left full of weeds to be casually sown, after seve-

ral years, with natural grasses.
"When turnips were first introduced on farms, and for some time after, the most common application of them was to the fattening of cattle.-Sheep did not then form any important part of the stock of arable land: but on light soils the full benefit of this crop was not obtained, until it had become the practice to consume the greater part of the crop on the ground by sheep. The poorest sandy soils seldom fail to yield an abundant crop of corn after turnips thus consumed on the ground. They are thus at once manured and strengthened

in the staple.

"On dry loams, the best practice is a medium between the old and the new; and the crop is divided between the sheep and the fold-yard, by drawing off and leaving a few ridglets alternately.

"The vast addition made both to the quantity and the quality of the dunghill, by the consumption of green clover and turnips, powerfully recommends them; and turnips accordingly are cultivated for this very purpose, on soils but little adapted to their growth as an edible root. When grown on clayey soils, the whole crop is still cot

"So the best mode of consuming clover and rye grass is to pasture it, especially on thin dry soils; compared with which the mode of reserv

On lands less fit for pasturing, deep loams and clays, soiling is resorted to. A considerable por tion of the grass is cut green for horses and milch cows; and in some instances, both for rearing and fattening of cattle. This economical use of the grass in the homestead augments and enriches the dunghill."

> (To be continued.) - B

HISTORY OF THE WHITE FLINT WHEAT. Albany, September 28th, 1824.

TO THE BDITOR OF THE AMERICAN FARMER.

SIR,-As your invaluable "American Farmer" has become in some measure, a standard for agri-Different soils require a different rotation, and cultural information and reference, I will now rebrated white flint wheat, by a concise review of its of justice due to Ira Hopkins, Esq. of Cayuga Co. to be repeatedly beneficial on the principal sorts in this state, to vindicate the ground assumed by

> It will be seen in my history of the Berkshire Agricultural Society, published in a small pam-phlet in 1819, at Nath Maxwell's, that I had despatched circulars to all the American Consuls them to collect and transmit to me through the Collector's Office in New-York-seeds, animals, &c. &c .- the ensuing March I received from the Custom House a cask, containing 16 varieties of grain in separate bags, accompanied by the follows

ing letter :-

affording a solution why the blossoms and fruit of a graft should preserve their distinguishing peculiarities, unaftered by connexion with the stock.

† In a given volume of air, their proportions are usually found to be: Oxygen 21-100; azote 79-100; earbonic acid gas 1-500 max. 1-800 min.

Valencia, (Spain,) 24th Dec. 1818.

SIR-I send you by the Brig Paragon, Capt. Austin, sixteen different kinds of grain, in separate bags, numbered as at foot; principally wheats, the produce of the province of Valencia. I shall embrace every opportunity to send you such agricultural products of this fine country, as may be useful to our own.

I shall shortly send you near one hundred va rieties of wheat and barley, which I am promised by an eminent botanist, who is preparing a work for publication, on this important subject.

I am respectfully yours, &c.

O. RICH, American Consul. Elkanah Watson, Esq. New York.

No. 1 Hard white Wheat. (a)

2 Hard red Wheat, (b) 3 Black bearded soft Wheat,

Black bearded hard Wheat, Hard red Wheat,

Hard red Wheat, a different kind,

Oats, Moorish Wheat, Soft white Wheat,

10 Close spiked Barley,

11 Common Barley, 12 Soft red Wheat,

13 Soft white Wheat,

14 Soft Wheat, very white, 15 Soft white Wheat, a different kind,

16 Hard red Wheat, superior.

The following note was endorsed on the back of the letter :-

"The 16 bags of grain are now in the public store, and will be held subject to your order."

D. GELSTON, Collector.

I devoted several days in the Capitol at Albany, with two or three hands in folding the whole into small parcels for general distribution; first to the Seneca and Cayuga Counties in this state, within members of the Legislature, then sitting in the a few years. same building, who witnessed my zeal and labours; and the residue in all directions. It was not till the month of November, 1823, I was first informed by Mr. Hyde, a very respectable and candid gentleman of Aubern, then sick in Albany, that part of the white flint wheat I had imported from Spain three years previous, was then in successful cultivation in Scipio, Cayuga County—and that they had floured about 30 bushels at his mills. -He spoke in the most exalted terms of the invaluable properties of this new wheat-and the super-excellence of the flour it produced. On the 23d March last, Joseph L. Richardson, Esq. also of Aubern, (who appears in your No. 20) wrote me thus, "the white flint wheat now in great repute, is cultivated by a few persons in this County, the first I heard of it was last year. I have been unable to ascertain its origin: it is said it was first introduced from Sicily, by General Mashington in 1790, but I have been lately informed we are indebted to your exertions for the blessing."

I will only add, that reported to have been brought from Oneida Counvariance with his previous admissions to him and bushel—the berry rather smaller than the white wheat-falls sooner by its thrifty growth-head short—well filled—light chaff—crop sowed 17th Sept. 1822, reaped 17th July. I sincerely hope wheat from all others, inasmuch as it is admitted species-so as to enable them eventually to select the one for general cultivation; experience may

Every candid mind will admit the impossibility of the existence of a wheat of such intrinsic worth ing cultivated, agreeably to Mr. R. in Pennsylvania, Jerseys and other places for 47 years, and yet to be unknown till recently—the assumption

But what is more conclusive and fatal to Mr. Richardson's assertions :- the white wheat is now eagerly procured from Seneca and Cayuga Counties, from the very Counties where it existed, according to that gentleman, nearly half a century ago.—With these remarks I shall rest the subject forever, with a sincere regret that I have been compelled to appear once more before the public in self defence, for I find myself assailed in the evening of life, in a spirit of persecution, however disinterested my unremitted efforts for a third of a century, to promote the welfare of my fellow men, to the utmost stretch of my limited powers:

ELKANAH WATSON.

This may certify, That we the subscribers, of the town of Scipio, in the county of Cayuga and state of New-York, have raised the white flint wheat, with great success, for the last two or three years, and have seen it growing by the side of different kinds of Wheat; and it has, with few exceptions, exceeded any others one third, and frequently one half in the same field. It is a white chaff bald wheat, with a fair white berry, In a second letter of the 1st April, he adds, open in the channel.—I transmit you samples of stands the winter remarkably well, and spreads "I have an unconquerable aversion to have my each to enable you to compare them. You will and thickens up in the months of April and May more than any other kind of wheat which we have ever seen. It has a small straw, thicker than to give notoriety to such facts as he could establish on a subject so interesting to the community.

"The selection of seeds (according to the do-

because when the latter begins to decay it becomes 'bleached by the oxygen of the atmosphere,' and no further nourishment can then be

conveyed to the ripe seed.

"Various expedients have been devised for the preservation of seeds; the most simple consist in excluding them from the light and heat in the bowels of the earth; where they will retain their vegetative powers for several years. Thus Dr. Darwin mentions instances of mustard seed producing a crop on digging up soil where it had remained in a state of rest for many years, and 'as was believed even for ages.' In the same manner the best cucumbers and melons are raised from seeds which are at least three or four years old though some gardeners do not employ them till they have been kept ten or twelve years.

"It appears to be an opinion, settled among the best practical and scientific cultivators, that very little advantage in common cases, is derived from changing seeds and roots on his own premises .-This is the least troublesome, least expensive, most independent, and most profitable mode of

question but they will be generally adopted when- nually added to the population of this town. ever a new line of conveyance has become necessary, either from increasing trade, or from the exorbitant demands of canal proprietors.

By the loco-motive engine fifty tons of goods nav be conveyed by a ten horse power engine, on a level road, at the rate of six miles an hour, and lighter weights at a proportioned increase of speed. Carriages for the conveyance of passen gers, at the rate of twelve or fourteen miles per hour. For canals it is necessary to have a dead level, but not so for rail-roads; an engine will work goods over an elevation of one-eighth of an inch to the yard .- Where the ascent or descent is rapid, and cannot be counteracted by cuttings or embankments, recourse must be had to permanent engines and inclined planes, just as recourse is had to locks for canals; but here again the rail-road system has a great advantage; the inclined plane causes no delay, white locking creates a great deal.

Two acts of Parliament have already been obtained, namely, the Stockton and Darlington Act, and the Moreton Act. On these lines, which exceed thirty miles each, it is intended to adopt the loco-motive engine, and they will both be very soon ready for conveyance of goods. There are also three or four other rail-roads

projected.

The discovery of the loco-motive engine it is said will be almost as important to the trade and commerce of this country, as the discovery of the steam engine itself.—Albion.

STEAM CARRIAGES.

It is proposed in England to substitute iron railways for roads, and employ steam engines instead she mercilessly plucked even the minutest birs of the great number of teams of horses and oxen, from the face of her mistress. now used to transport travellers and merchandise. The distance from London to the principal cities of England will be reduced one-quarter or even ficient to cleanse them, they were rubba with one-third by the construction of rail-ways, in a right line and the numerous windings in the roads will be avoided. The post from London, by this known at that period; and the coque es of the new arrangement will reach Manchester, Liverpool and Leeds in twelve hours, and only twentyfour hours will be required to arrive in Glasgow and Edinburgh.

It will cost about 20,000 dollars per mile to construct a double rail way proper for carriages both to go and return. The expense of a rail-way of four rows, is estimated at 58,000 dollars. The distance between London and New-Castle in a right line is about 200 miles. The establishment of and hair, according to the ge or taste of the this kind of communication will cost therefore lady, this kind of communication will cost that the freight is a dollar each will yield the proprietors of the rail-way an annual revenue of 2,000,000 dollars, and will re-imburse their capital in less than six years. But the profits of the establishment from other articles of transportation will be immense. To appreciate of several metals, thick was given an exquisite polish. They mead to foot. Our computation of the number of power looms the amount, it is only necessary to remark that site polish. They be sometimes so the manufacturing district which surrounds one steam engine will be able to propel along the reflect the person in head to foot.

easily ascertained by the dryness of the stem : Manchester, and which, after careful inquiry, we rail-way in less than thirty hours from London to Edinburgh, three carriages laden with passengers and baggage which at present require three hundred horses, and reach their place of destination only in fifty hours.

Little feasible as the execution of this project appears, adds the French writer, "we dare say capitalists will be found in England venturous exercise their reasoning powers upon commercial enough to furnish the funds, and engineers skilful enough to overcome the obstacles which seem to render it impracticable."

The Toilet of a Roman Lady .- A woman of quality, on leaving her bed which she usually did 145,000,000 about 10 or 11 o'clock, repaired to her bath. After remaining there for some time, where she was £10,875,000 carefully rubbed with a pumice-stone, she came forth to pass into the hands of the cosmetes. These cosmetes were slaves, who possessed many se-crets for preserving the skin and complexion, and

The moment she left the bath, a sort of catabuildings and machinery cannot be less than plied to her face, which she took off only when 10,000,000%. We calculate that the rental of she went abroad, or on the arrival of a stranger; so that the poor husband could never see his wife without her features being covered with this mask, which she often replaced in the evening to preserve her face throughout the night from the contact of the air.

> As soon as she began her toilette, a slave re-moved it, and bathed her face with a spung steeped in asses' milk, whilst another endeavoured to give to the skin all possible freshness by rubbing it, according to Pliny, with the ashes of snails, or in which the bees had been smothered, with the fat of a pullet mixed with onions, and lastly, with the fat of a swan, to which they attributed the pro-perty of removing wrinkles. Her next care was to efface any red spots with a piece of woolen cloth, steeped in oil of roses, and to remove freckles with a scraping of sheep-skin, mixed with the honey of Corsica, to which was sometimes added the powder of frankincense.

This operation finished, a third slave approagaed, provided with a pair of pincers, with which

This duty of toilette over, that of the eeth commenced. When fresh water was found insufgrated pumice stone, or marble dust, method still employed. The use of tooth-bryles was time, like those of the present day, placed the teeth they lost with false ones, which were fastened with gold. To heal or preent chaps in the lips, they rubbed them with the in ide of a sheep skin, covered with a gall-nyointment-or, what was better still, with the ries of a burnt

mouse, mixed with fennel root.

The teeth being cleaned, a tod class of slaves appeared to colour the eye, shes, eye brows,

THE FARMER.

BALTIMOBE, FRIDAY, OCTOBER 15, 1824.

THE NATION'S GUEST.

We are sure it is not expected of us to give the

He arrived on Thursday agreeably to appointment, and was presented at Fort McHenry to Governor STEVENS, who, in behalf of the people of the Society of Cincinnati, assembled within the source, probably not so good. Fort under that identical tent in which he had so often shared the frugal meal and aided the counsels of Washington. The "tent scene" was glass (if in summer one ounce and a quarter, impressive beyond description. This meeting of this venerable remnant of patriot warriors, under such associations was perhaps the finest moral spectacle that ever was witnessed. What was perhaps the finest moral spectacle that ever was witnessed. What was or ten bitter, and half an ounce of sweet almonds the consequence of the measures resolved upon in the consequence of the measurement of the consequence the consequence of the measures resolved upon in very fine, with a spoonful of rose water, and mix the councils held under that sacred canopy? Noth-them with the mills, strain it through a lawn sieve ing less than the freedom and happine s of millions or napkin into a basin, with half a pint of good lows:apon millions for ages and ages to come! But we cream, let it stand half an hour, hour it into another must at once check the feelings that would naturally spring from the contemplation of this distinguishing feature in the tout ensemble of his receptory of the mould seem of the mould seem of the spring from the tout ensemble of his receptory. tion in Baltimore, and go on, as briefly as possi-ble, to state, that after taking some refreshment with slices of orange.

M. B. About half a gill of Noyeau may be sub-ments for the essential services you have renderunder triumphal arches and the cheerings of stituted for the Almonds.

100,000 citizens, to the Exchange, where he was name welcomed by Mr. Johnson, the Mayor, with tude. a sensibility honourable to his heart, and with sentiments worthy of those for whom he acted.

On that day he dined at the elegant apartments prepared for him at Mr. Barney's Inn, in company try, by causing the plant to suffer what planters with his old revolutionary compatriots and a good-serm firing. The richest lands have suffered ly number of the corporation. On the next day most, particularly where they are strong. It seems to be a disease arising from an excessive quantity of circulating fluid in the plant, as after much rain, or a sudden check given to the circulatine fluid in the plant, as after gant dinner given by the Cincinnati Society. It the weather turns suddenly cool. Our corn crop was soon found to be impossible without the asyielded badly in proportion to the straw, but is of sistance and direction of the Ladies. And for what enjoyments, worthy of being externed and what enjoyments, worthy of being esteemed such, are we not dependent on them? Did not Jaffier when he exclaimed-

Oh woman! lovely woman! nature made thee To temper man. We had been brutes without you! Angels are painted fair, to look like you; There's in you all that we believe of heaven; Amazing brightness, purity, and truth, Eternal joy, and everlasting love.

A committee of ladies of the very highest respectability was appointed to superintend the prethe Nation's Guest; and we understand it to have over excelled even the anticipations created by their acknowledged taste. The preparation of of all that art could do; and having solicited an op-TRASURY OFFICE, Annapolis, Oct. 5th, 1824. portunity of seeing this particular portion of the repast, as an object of curiosity in the highest branch of the culinary art, we can safely assure our fair low-citizens. readers, of whom it is our boast to have many, that we never saw, neither had we conceived any thing in this way so exquisitely delicate and beautiful. Of this particular article there were four representing to the very life in form, size, and colour, oranges, pears, bunches of grapes, peaches, asparagus, indian corn, and a variety of other fruits and vegetables; besides fishes of gold and silver hue, so perfectly represented, that nothing details of General La Fayette's movements in but the knife or the palate could detect the deluhis progress to the great meeting at York, in Virginia. These movements have been minutely, and beautiful exhibition of this elegant art that and we may add, faithfully detailed in all the daily has ever been seen in this country—worthy, in a journals; still we shall be excused for giving a gen- word and in its way, of the occasion * A soldier which appear in this number of our journal. eral outline of his reception within our own State, and patriot of less gallantry than Gen. In regard to this festival on which so many Associations conferred peculiar interest, we are glad to see, in the newspaper account of it, that at least here, in a volunteer, if not in a regular toast, the immortal Franklin, amongst the earliest and fastest and best friends of La Fayette, was not forgotten. The venerable W. PATTERSON, in heart an American, in services a revolutionary soldier, by birth an Irishman, offered to the company, "BENJAmuch rain, or a sudden check given to the circu-much rain, or a sudden check given to the circu-lation, causing a rupture of the vessels, as when And since Gen. La Fayette is gone and this is the only recall we have seen of the memory of that patriot who glorified his country, we claim the privilege of recording, that on the preceding evening at the ball supper, he was presented to the pabut express the common feeling of all refined hearts triotic recollections of the company by one American citizen, in a volunteer to the memory of "BENJAKIN FRANKLIN, by trade a printer, by self instruction a philosopher, statesman, and moralist." On all patriotic occasions his name should be on our lips, for be it remembered, that "in the fullness of the heart the mouth speaketh."

. The Ball given on Friday night transcended the anticipations of all, as it does all power of description. It was for the active managers, a reparation and display of this sumptuous dinner to sponsible and most critical undertaking; one which might even by trifling omissions have caused great dissatisfaction. It was executed throughout in a manner to give universal pleasure and astonblancmange was by common consent, specially con ishment full of delight at the splendour of the fided to the superintendance of the Misses S. and spectacle, and the regularity with which every E. Merryman, whose superior taste gave promise thing was conducted. They reflected credit on of all that art could do; and having solicited an option of the city, in the eyes of all who came from abroad; and we do not hesitate, therefore, to say, that they eminently deserve the thanks of their fel-

On Monday the General attended divine service at the Cathedral, the most splendid house of worship in this country. Visited after, at Belvidere, the hero of Eutaw and Cowpens, and passed and twenty dishes, one for each state in the Union, the evening with General SMITH in company with a large party composed of the general's particular friends.

On Monday he, at the instance of Major General HARPER, reviewed his Division, and departed about four, P. M. for Rossburgh, a commodious Inn, about nine mites this side of Washington.

During his stay the General was welcomed by a deputation of Members of the Maryland Agri-

seems to possess, might have felt flattered at this Proceedings of a Special Meeting of Members of the Maryland Agricultural Society.

At a special meeting of members of the Mary. land Agricultural Society, on the 7th inst. it was Resolved, That R. Smith, Esq. President of the Society, C. Ridgely, of Hampton, Samuel Owings, Nichelas Bosley, David Williamson, jr., James Gittings, Jacob Hollingsworth, B. W. Hall, James Carroll, jr., Christopher Carnan, James Cox, Jas. Howard, and J. S Skinner, be a committee to present to Gen. LA FAYETTE an expression of the affectionate regards of the Society. The next morning at 11 o'clock, Mr. R. SMITH, as Chairman of the committee, addressed the General as fol-

We are, General, a deputation from the landed interest of the State. The Maryland Agricultural Society have appointed us to express to you their high sense of the pleasure you have afforded the American people in their mighty struggle

lustrious career, civil and military, has furnished abundant proofs, that your sole object, in thus aiding us, was the advancement of the legitimate rights of man, and that, at the time, you contemplated no applause but that which is bestowed by after ages on useful and virtuous actions,

It is a source of no small gratification to our Society to learn, that you have yourself become a to the cultivation of the soil as much of your time and attention, as your multifarious avocations will permit. Be this, however, as it may, it would afford us great pleasure, could you, consistently with existing engagements, favour us with your company at the next publick exhibition of our Society which is to take place in the course of next month. You would thus be enabled to form an estimate of the accelerated march of our agricultural improvements under the auspices of political institutions which you have so much contributed to establish. But, General, whether we can or cannot have the honour of your company, known that a gang of these light-fingered gentry list should any such be presented.

We entreat you to accept our cordial thanks for have gone South. No man should take with him

These Committees shall examine the state of the stat past services and our best wishes for the preservation of your exemplary life in health and in happiness.

The reply of the General, from the sensibility evinced was truly impressive. He most feelingly assured the committee that he was under inexpressible obligations for this demonstration of kindness from the cultivators of the soil, and that he had, on this occasion, the more pleasure, as he PRICES OF COUNTRY PRODUCE-carefulhad the honor of being himself a practical agri-culturist—an honor of which he was particularly proud. Feeling, as he did, a deep interest in whatever may contribute to improvements in agriculture, he will have great satisfaction in attending the next meeting of the Society. And of this do 38 cents—Rye, 37½ cts—Oats, 20 cts.—Whispleasure nothing shall deprive him but the occur-key. 28 cents—Apple Brandy. 25—Clover Seed rence of circumstances not within his control.

General LA FAYETTE, his son GEORGE WASH-INGTON LA FAYETTE, and his Secretary Auguste LE VASSEUR, were unanimously elected Honorary Members of the Maryland Agricultural Society, and their Diplomas were delivered to them by the President; on the acceptance of which they expressed particular satisfaction.

POSTPONEMENT OF THE MARYLAND CATTLE Show-for the Western Shore.

This great annual festival of our farmers has been postponed to the 23d, 24th and 25th of Nov. Various considerations led to the adoption of this measure-first, the days previously fixed upon, happened to be on the days of the yearly meeting of Friends in this city-and it has always been a matter of particular pleasure to the members of the Society, as well as an eminent advantage to the Institution, that its objects have been the products of American Industry, will be held Reference as above. approved and patronized by that industrious and on Monday, Tuesday and Wednesday, the 18th, most exemplary class of our citizens.

It was thought, too, that the number of recent occasions for bringing the people from their homes, and especially the all-absorbing curiosity to see, and desire to pay respect to the "Nation's Guest," would prevent many from so soon leaving their homes again, and finally, when Gen. La Fayette accepted the Diploma of Membership of our Society, he claimed for himself "the honour of being a practical agriculturist," declared his partiality for its pursuits and expressed a strong desire to be present at our next exhibition; when if he can attend, as it is hoped and expected he may, hibition, from 9 A. sary to retain the clover and rye-grass division wish that Mr. Ducket, the able cultivator, of Pefor some years in pasture, unless more manure is tersham in Surrey, would have communicated his ter. In winter, on land where no crop or seed is applied to such land than can be returned from its thoughts not only on that subject, but would have lodged, but where annual or other plants are to own produce."

ROPATIONS WITH A FALLOW:

"On clayey loams the rotations are more varicd. On strong clays, beans is the best relieving succession crop; and although it cannot be pro posed as a perpetual substitute for a summer fallow, in alteration with wheat or any other exhausting culmiferous crop, -yet when drilled, and hand and horse-hoed, beans supersede the necessity of fallowing eftener than once in a rotation of six or eight years. Wheat and beans have been taken alternately for a series of years, even as many as eight, on the best soils; but the most frequent courses are of four and six years. The four years' course is renewed in this order: 1. Fallow; treading the soil, and rendering it more compact and firm, which a light soil requires... Besides.

2. Wheat; 3, Clover; 4. Oats. The six years' this complete the former to leave a leave of the six years' this complete the former to leave a leave of the six years' this complete the former to leave a leave of the six years' this complete the former to leave a leave of the six years' this complete the former to leave a leave of the six years' the y course revolves, with nice adaption to every crop, thus: 1. Fallow; 2. Wheat; 3. Clover and Ryegrass; 4. Oats; 5. Beans; 6. Wheat. Or the six years' rotation is sometimes varied thus: 1. Fallow; 2. Wheat; 3. Beans; 4. Barley or Oats; and thus unites the system of continued pasture 5. Clover and Rye-grass; 6. Oats: but by this arrangement the land is neither so clean, nor so well pulverized, as it should be in preparation for clovers. On clayey soils a complete fullow is considered as the basis of every profitable rotation orop by the most judicious farmers of Scotland; and according to their concurring experience, on pone a fallow for more than eight years, have hithereto been successful in that part of the island."

Some of the Papers in the above-mentioned General Report, which record this result, allude or portion of the year than in most parts of England; and in some degree attribute the failure, with them, of the non-fallowing system to that cause. But having no system to manufacture for

the tenor of which agrees with the above, both in gard to Mr. Ducket. the inclination to dispense with fallowing, as far to eventual gain.

Very striking circumstances are connected with the Letters on Agriculture, from which we are going to borrow almost the counterpart of the above. First, these Letters are not behind the intelligence of the present day, though written ave and twenty years ago; for rejecting some of the speculative notions which were then in fashion, the writer took at once the tenable ground to which experimental agriculturists have in general reverted. Secondly, they are attributed to the pen of His Majesty George the Third;—a reach of flattery, is still praised and revered by

AGRICULTURE OF HOLKHAM.

land, to his friend in Virginia, dated

"HOLKHAM, 10th July, 1824.

As you are a renowned farmer, I thought it in the beginning of spring, the moisture that has most classical to give you a few lines from the cepenetrated deep into the soil, and even the sub- lebrated domain of Mr. Coke, the great agriculsoil, becomes a source of nourishment to the roots turist and opulent commoner, especially as I find of the plant in summer; and prevents those bad paper, pen, ink, wax, &c. on the table, to which I effects that often happen to lands in their natural am shown in my lodging room. Here you have handsomest cattle I have ever seen. He is for state from a long continuance of dry weather." every thing at your elbow, and need no further saking his old stock of sheep, which was solid fat. The alluvial matters which the water may have waiting on. The house is on a scale of which you has, what he calls, the improved Down. diffused through the veins of the land is undoubt have no idea : in his manners Mr. C. is quite edly beneficial: but, were the water which has plain; he is very communicative and most pro-conveyed them to stagnate in the subsoil, it would fusely hospitable. He is a true whig, and has al-be more pernicious to most plants than the ways been on the American side in our controversies with England, for which we ought to like him.

I have learned in Norfolk, that our mode of by this distinguished Chemist; the substance of trying live hedges has never been fair. They are which may be given without protest or comment the great ornament of England, and are well as principles consistent with experience-altho' worth a further experiment; though I doubt if on your bed; one of which, and sometimes the they are placed on an original foundation, which our unlearned pigs would not penetrate them other, is necessary. Yesterday we had a fire.—It enlarges the sphere in which irrigation may be even in Norfolk. The thorn should be planted in rains almost every day, generally light showers. double rows, each plant being about four inches "When the water used in irrigation has flowed from its neighbour, thus,-they should be over a calcareous bed, it is generally found im-pregnated with carbonate of lime; and such wa-should be trimmed every year on the sides, so as ter tends, in that respect, to ameliorate a soil in to make them shoot upwards and to make them proportion as any of the modifications of lime dense. Moreover the seeds should be sown in a idea can be formed of the crop. Mr. C. says, and charcoal were deficient; but where these are nursery, and the young plants removed when you that it is not so uncertain a crop with him, as it is

The sheep and turnips are the great matter nated with sand, clay, gypsum, or particles of here. I find the turnips are subject to many accidents from the fly as with us. They put them "Common river water generally contains a cerd in drills—I saw some yesterday with four or five tain portion of the constituents of vegetables and small leaves. The produce of sheep is amazing animal bodies; and after rains this portion is great. I mean the yield in money. Mr. Coke has lately er than at other times: it is habitually largest sold sheep, fifteen months old, thus,—fleece, 10s.; per, and reflecting that one great object of it is to when the source of the stream is in a cultivated meat, in London, 37s., equal to 1£. 17s. sterling. dissipate all erroneous theories which may be Mr. Coke's method of cultivating turnips is worth prevalent among the agricultural part of the com"In general, those waters which breed the best one trial. I never saw it in Virginia. The ground munity, I determined to prepare the following refish are the best fitted for watering meadows; but is nicely prepared in drills, the seeds are sown marks for consideration. Anticipating the plant-most of the benefits of irrigation may be derived very thick in drill to allow for the ravages of the ing of a nursery, it remained to me doubtful which from any kind of water—provided the soil be not fly, and still have plants enough. He assures me was the most expedient method; for not long already overcharged with the prevailing ingredited in the deposit left by the water; and provided, on the other hand, that the matter of the soil and the matter of the deposit are not pernicity with the matter of the deposit the matter of the deposit are not pernicity with the matter of the deposit are not pernicity with the matter of ous when combined. These are general princi-ment for cultivating the ground about them. It and then they would fulfil the expectations of the ples: 1. That waters containing ferruginous im-pregnations (particles of iron) tend to fertilize a very neatly, and never touches the top of the ridge per (vol. iii. p. 41) the opinion of Mr. Miller, the

They make no use of plaster of paris in Eng-Supposing the farmer to have a complete com- land as manure. But the quantity of stable ma- and vegetable creation, I should suppose that the mand over contiguous water containing a suitable nure they put on the ground is amazing. I never most credible testimony appears in favour of the alluvial deposit, he may render a cultivated level, saw, except on asparagus beds, any thing like it. former instead of the latter,—that young trees which requires rest and a cheap manure, extreme I assure you it is unpleasant to ride near a newly should be fed with an increased proportion of food, ly productive with comparatively little labour, ploughed field, from the smell of the stable yard. instead of diminishing as they increased in age. thriving condition, and fed daily with what nature thriving condition, and fed daily with what nature thriving condition, and fed daily with what nature level, except a few barren hills. There is more actually needed for a time; now diminish their the land, so that some shots should be covered land which was by nature barren then I supposed, food in time of necessity, - would these soldiers with ice for some days, the shot so covered with ice but then they have lime, chalk, &c. every where, will be of a darker green, and appear more heal and grass seems to grow kindly even on the poor- what the country [the husbandman] expected.

Holkham, a muskmelon, grapes, strawberries, raspberries, and cherries; the grapes fresh from the hot-house, beautiful purple ones, but not equal in flavour to those we have eaten at Mr. -The strawberries were enormous, beyond any thing, but not so sweet as ours.

Mr. Coke is greatly enamoured of his Devonshire cattle. He says the oxen are ar superiorthe milk, the butter, the meat, and every thing better. They are uniformly of one colour, somewhat of a redish bay, with long horns; not very large, but round and well formed, and are the He now has, what he calls, the improved Down, which he thinks every way superior. But I have seen no mutton better than our own, certainly none so good as the Alleghany. The beef is generally better than ours, and instead of eating it half raw as you hear, it is cooked most admirably.

The climate is cool beyond what I had supposed. You see most people travelling in cloaks in June and July, and you always find two blankets

The wheat and barley of Holkham are throughout as good as the best I ever saw—butthat is not the case elsewhere. The wheat is often very foul, sometimes irregular in its growth, but generally looks vigorous-it is now in flower, but no generally represented to be in England.

and the moment the fisherman crosses his thresh hold, the pond is agitated by the action of some hundred fins, and otherwise thrown in a state of perfect anarchy and confusion. Darting from this, that, and the other corner, the whole population move, as if it were, to a common centre, elevate their snouts, lash their tails, and jostle one another with such violence, that on a first view, they actually appear, to be menacing an attack on the poor fisherman. Many of the fishes are so tame that they will feed greedily from the hand, and bite your fingers into the bargain, if you are foolish enough to let them; while others, again, are so shy, that the fisherman discourses of their different tempers, as a thing quite as palpable as the gills they breathe or the fins they move by. One gigantic cod, which seems to answer to the name of Tom, and may be well described as the patriarch of the pond, very forcibly arrests attention. This unfortunate, who passed his youth in the open sea, was taken prisoner at the age of five, and has since sojourned at Port Nessock, for the long period of twelve years, during all which from age or disease, that he has no chance what-ever in the general scramble. The fishermen, however, are very kind to him, and it is really affecting, as well as curious, to see the huge animal head on the flat stone, allow it to be gently patted or stroked, gaping all the while, to implore that food which he has no means of obtaining. during two or three days of every week.

WEATHER WISDOM.

Almost all mankind are desirous, first or last, of attaining a good degree of that species of knowledge, which is commonly called among the peotime he has gradually increased in bulk and ple at large 'weather-wisdom'-that is, of being weight. He is now, however, so wholly blind, able to prognosticate, by the help of various signs and symptoms, what kind of weather is approaching. In order to find employment for this disposition of mind, the almanac makers have from time immemorial, introduced into their annual raise himself in the water, and then resting his publications, the various kinds and changes of weather, that were generally considered as appropriate to the various months, and weeks, and days of the year. And such implicit reliance has The flooks which live on worms and other insects, often been placed by many persons on these proshun the light, by burrowing in the sand at the phetic annunciations, particularly in the most apbottom, and never ascend to the top in quest of proved almanacs, that no small number of honest food. Salmon, which, at spawing-time, visit the highest rivers, could not, of course, obey their selves in their daily labours, by a strict attention instincts here; and, accordingly, there is only to the information of the state of the weather one specimen of this favourite fish in the pond at foretold in "Ames's Almanac," which for a long present. Still, however, he is one among a hun- time was almost the only one in use in the New dred; for as the fisherman remarked, "he is far soupler than ony o' the rest;" and, by virtue of this one quality, chases, bites, and otherwise annoys a whole battalion of gigantic cod, that have hay, but who dare not venture a step until they only, one would think, to open their mouths and had first examined the almanac, in order to asswallow him. To supply them with food is an important part of the fisherman's duty; and with be propitious to their labours, resorted to that inthis view, he must ply the net, and heave the line fallible directory for information. It so happened that the very day which they had selected to begin mowing, was that on which a court was to be held at Barnstable in Massachusetts; a fact that was also noted down, according to custom, in The Board for Internal Improvements met in the calander, and immediately after the name of this city on Monday last, present D. Cameron, the place where the court was to sit, was inter-information respecting salted hay: my cows live John D. Hawkins, Thomas Turner and John Owlarded 'thunder'—it being natural to expect thunder on salted clover in the winter, and thrive better en, Esqrs. PREPARATION OF SEED WHEAT.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir,-As there is frequently a great difficulty in procuring good Seed Wheat, I am induced to have successfully pursued, and by which means the seeds of any noxious weeds, which are lighter than the purest wheat.

Make a pickle of any coarse or refuse salt, sufficiently strong to bear an egg or potato, pour, gently, into it your wheat, and sieve off with a calander whatever may rise to the surface; then drain the wheat in baskets, and dry it with quick PUBLISHED IN THE AMERICAN FARMER, BY OR lime, plaster of paris, or ashes; the former I pre-fer. You may suffer the seed to remain in soak the grains swell proportionably.

DAVID WILLIAMSON, Jr. Baltimore County, 11th Oct. 1824.

AMERICAN SURGERY.

For the first time in America, the operation of taking off the thigh at the hip joint, was yester-day performed at the New-York Hospital by Valentine Mott, the Professor of Surgery in the Col-lege of Physicians and Surgeons. The patient was a boy of about twelve years of age, labouring under a case of necrosis, or decay of the thigh bone. The operation was completely successfuland was endured by the little patient with great fortitude. His symptoms since, have, as we are informed, been of the most favourable kind: and dangerous, but in his case unavoidable experiment, it will confer renewed honour on the already distinguished operator, and add to the renown of dred and twenty-four. the profession in this country.

The Races on the Union course commenced yesterday. Mr. Wynn's mare, Flirtilla took the purse of 500, no competitor having entered against her How much was effected by this \$500 towards improving the breed of horses? The sweepstakes were won by Mr. Laird's colt, Count Piper, distancing two, and beating one competitor, two mile heats.

The following horses are entered for this day's purse of \$300-three mile heats :- Mr. Laird's this office. mare Modesty, rider's dress, yellow .- Mr. Wynn's

to give some to my cows, but they did not like mare Vanity-red and yellow .- Mr. Jackson's mare Slow-and-Easy-yellow and black dress.

THE CULTIVATION OF THE VINE.

The culture of the vine seems to have become won a match race ten days previous-running two a favorite pursuit with the agriculturists of the present day. There are perhaps not less than fifteen or twenty vineyards within as many miles of the Borough of York, Pennsylvania, and nearly all commenced within a year or two. Should this disposition increase, and as a consequence, the wine press be made to take the place of the disnity. Among what is called civilized nations, the turn their eyes to France. That country, though not the native land of the vine, has, at the present masters of vessels and others preparing sea stores. day, almost four millions of acres employed in its cultivation. The average production of these immense vineyards, is about one thousand millions of gallons; and the whole annual value of their vintage, about one hundred and twenty-five millions of dollars .- Recorder.

Method of securing the BLOSSOMS OF FRUIT TREES against destruction by late frosts.

Place, around the roots of the trees, banks of snow or ice.-The blossoms will be retarded, and thereby escape the late frosts, that are so destructive to our fruit trees in this climate.

The Serpents in the Tower.

The public, we believe are not generally aware of the existence in the Royal Menagerie at the Tower of a very fine collection of that species of snake called the Boa Constrictor. We were induced to attend there on Monday last for the purpose of being witness to the mode in which these animals receive their sustenance, and to discover how far the description given by various authors of their manner of disposing of their prey tallies with what might actually occur under our own observation. The animal selected by the keeper quarter commencing on the 7th day of July, and for the purpose was the largest there, and measured, we believe, 10 feet in length, and 7 inches in diameter in its thickest part. Previous to receiving its prey, it appeared very lively, and peered about with its head in all directions, occasioning its body to assume those beautiful curvations of which the snake species are so capable. On perceiving the approach of the keeper with the rabbit destined for its meal, it withdrew all appearance of vigour and motion; but the moment the rabbit was placed in the cage, it seized its head with so astonishingly rapid a motion, that TREASURY OFFICE, Annapolis, Oct. 11, 1824. the eye could not keep pace with it, and by a si-True Copy from the original report on file in multaneous action of its body, it compressed its folds so tightly round that of the rabbit as to crush levery bone that was within its grasp. This rapid

change was nervous to behold, and a vivid imagi- good season at Easton on the same evening, touch-nation could not but picture to itself the fearful ing at Annapolis on her way. A great number of added much to the interest and beauty of the country, in many respects, singular and beautiful. spectacle. When the rabbit was motionless, the snake gradually loosened his folds, still retaining his hold by the head; and having fully ascertained the death of his victim, he proceeded to stretch the body of the rabbit, which he very cu riously performed, in drawing it by the head through a ring formed from the folds of his body; this he repeated until the whole was a mass. Af ter lubricating the head very much, but no other action he accelerated by pushing it down his throat against his own body, and by a strong re La Fayette was withdrawn, and Flirtilla ga traction and re-expansion of the muscles which round the course and bore away the purse. lay at the back of the head; by degrees the animal disappeared, until nothing more was visible than a long lump in the snake's throat, which it PRICES OF COUNTRY PRODUCE—carefulimpelled forward by the action of the muscles, until it reached the middle of its body where it remained. Such is the mode of this animal's taking sustenance; and if we compare this account with those furnished by various writers, and particularly with that given by Dr. Macleod of the Alceste, we shall find them differ in nowise except in the circumstance of this snake's omitting to lubricate the whole of the body of its prey, which, however, may have arisen from the diminutive size of the object upon which it is fed; for the ease with which the rabbit was gorged, was so great as to lead us to imagine that a dog thrice the size would experience very little diffiseen in this country, the variety and brilliancy of the sheep and free from tags—Coal, pit, foreign, cultivation of wheat of its utility—this machine, whose colours are such as to excite the highest admiration in the visitors. BALTIMORE, FRIDAY, OCTOBER 22, 1824.

MEETING OF THE BOARD OF TRUSTEES.

The next meeting of the Board of Trustees of the Maryland Agricultural Society, for the Western Shore, will take place at Hayfields, the residence of Col. NICHOLAS BOSLEY, on Wednesday next, the 27th of October. The near approach of the next Cattle Show, and the arrangements to be made preparatory thereto, make it indispensible that this meeting should be well attended at an early hour.

Be it remembered that the next Fair and Cattle Show, for the Eastern Shore of Maryland, takes place at Easton, on Thursday, the 18th day of next month. The steam-boat Maryland leaves Baltimore on the preceding day, and arrives in

scene of crushing and struggling which the seiz- practical farmers of the Western Shore of Maure of such an animal as a deer or an ox would ryland, and of Pennsylvania and Delaware, have, create by a larger animal of this species. That within our hearing, expressed their determinasuch scenes have occurred, and have likewise tion to attend: and we think it in some sort the been witnessed, we doubt not; but until we wit-duty of the members of the Society of the Westnessed the convulsive but ineffectual struggle ern Shore, to do themselves that pleasure, seeing of the unfortunate rabbit in the ravenous and that we have been repeatedly favoured, not only gnarled grasp of the serpent on this occasion, our with the company, but with the co-operation and conception reached no farther than the common active assistance of so many gentlemen from the (3½ a 4½ feet long;) and when worked by the hand belief attached to the relation of the tremendous Eastern Shore, with whom it is always agreeable it got out eleven bushels, as I am informed by my powers of this species of snake. To enable the and honorable to be associated. Besides the no-overseer, and others who were present. This snake to gorge his prey with the greater facility, velty, and, to practical farmers, the actual advanthe was removed into the court-yard, when the glit- age of attending this exhibition, many will emtering of the sun beams upon his purple scales brace it as an agreeable opportunity of seeing a

Pope's Threshing Machine.

Free-hill, near Richmond, Sept. 24, 1824.

This is to certify, that one of Pohe's hatent threshing machines, (made in Washington) for threshing wheat, has this season threshed out my crop consisting of about twelve hundred bushels; and it will get out, with two mules, eighty bushels per day, it having done this for three days in succession from purple straw, above the ordinary growth, machine requires less force to work it than any other I have seen. J. M. SELDEN.

Carles, on James River, (Va.) Sept. 24, 1824. Sir .- In answer to your enquiry, relative to the CANTON RACES.

performance of your Machine, made by S. V.

The purse of six hundred dollars was taken Merrick & Co., Philadelphia, for me, I have to S. V. Merrick & Co. were badly built-the horse wheel being too small, and the materials too slender to bear the pressure necessary to drive the machine. When these defects are remedied, I feel confident that your machine will succeed.

Very respectfully yours, WADE MOSBY, Jr.

Mr. Joseph Pope.

Copy of a letter to the Editor of the American Farmer.

New-Kent County, 27th Aug. 1824.

Sir,-Having been induced, from the various

As I consider an agricultural implement of this description, of more importance to the farming interest than any other, considering its cheapness, power and usefulness, will thank you to insert this in the American Farmer, as I feel assured all those who are disposed to furnish themselves with these machines will not be disappointed.

I am, Sir, respectfully yours, J. M. DEL CAMPO.

tures,-Ploughing Match, &c.

We shall be able in this paper to give nothing more than a brief ontline of the proceedings, at be published by the several Committees of the Massachusetts Agricultural Society.

The exhibition of Animals was, we think, in all things equal, and in some respects superior to any which we have before witnessed. There were SECT. 4. The drawback allowed by law on plain few vacant pens, and the pens were in general filled with fine animals, good specimens of what our Farmers have done, and pledges of future im-provements. The Manufactures were likewise coloured, printed, stained, dyed, stamped, or paint-ed in the United States. But, whenever any such silks shall be intended to be so coloured, printed, tions was filled with things new, and we have no stained, dyed, stamped, or painted, and afterwards to the official accounts, which we hope soon to doubt useful, but, we must refer for particulars

> The proceedings of the 21st commenced with a prayer by the Rev. Dr. Foster. The Hon, Mr. LOWELL, President of the Society, then gave some eloquent, judicious and pertinent remarks. The Society, together with invited guests including many strangers of the first respectability, dined at the Mansion House of Mr. Dudley, where they were regaled with the choicest productions of the land we live in; to which were super-added many of the prime productions of other countries.

The feast was followed by sentiments which had a tendency to improve as well as to exhilirate. The following were among the number.

The President of the United States-May the chosen-be as popular, pacific, prudent, and prosperous as his has been.

The Farmers of Mount Vernon and La Grange, who have given dignity, by their example, to the earliest and noblest of arts.

Bunker Hill Monument-May it never be forgotten, that the Farmers proved on the day which or destroyed by accident; and no such application this noble monument is destined to commemorate, that they knew as well how to defend their soil,

Enlightened Agriculture-May our Farmers never think it above nor below their concern, to spector of the customs, and measured or weighed, learn the principles as well as the practice of their

Agriculture, Commerce, and Manufacturesthat the contents of each package are the same our rulers, that they may remain in equilibrio.

[BY THE EDITOR.]

Mr. Goodwin, of the delegation from the Ag-ricultural Society of the County of Worcester, page 94, we gave some breif observations relative

he Stock of the country, his associates were for practised in gathering apples, is more destructive in its consequences than is generally understood. Bull of M. Prince recently imported from North The first requisite is, to ascertain precisely when the fruit is wholly ripe, as it is said that the lonfrom the trees, or separate very readily on being touched by the hand. They should be gathered during a clear dry air, after the dew is evaporated. According to the late philosophic Dr. Darwin, in order to ascertain when fruits, for instance, apples and pears, are sufficiently ripe for gathering, it is requisite to attend to the colour of the skin, enclosing the seeds. During their infant state, there is no cavity round the kernels, but they are in contact with the seed vessels. In a subsequent period, when the fruit has exhausted the nutricious matter, the cells containing the seeds become hollow, and the latter assume a dark colour. This, Dr. Darwin observes, is the proper criterion by which to judge when such fruits should be gathered; as it indicates that they will not continue to increase in size, but waste and become hollow, by absorbing the mucilaginous particles from the centre. In gathering apples and pears, it is necessary carefully to avoid injuring the blossom buds, which are already formed for the next By the Hon. Judge Story-May the supply of who contend for milking her, see that their hands year's fruit. These buds are placed at the side of the foot stalk of the fruit, and if the spurs are broken, there will be no fruit on that part the next season. The pressing against the trees, therefore, with heavy ladders, and the rash practice of thrashing the trees with poles, ought to be entirely abandoned; for by such means, the bark and limbs are bruised, and the blossom buds for the succeeding year are destroyed. Instead of ladders, stepping frames should be employed, and a pole, furnished with a hook at the end, and covered with coarse cloth, may be used to shake the small limbs, without injuring the bark. When without injury to the buds, but still they will be bruised, unless the ground be covered with blankets or straw. Particular care is requisite in gathering winter fruit for keeping:—they should be gathered by the hand, and without injury removing them from the gathering basket to the casks prepared for them, with great care; if bruised, they soon decay; and the less those that are sound are removed, the better .- When in barrels, they should be placed in a dry, cool, shaded situation, above ground, and remain until in danger from frost, and then put into the cellar."

"It is the practice with some persons, to pick them in October, and first spread them on the spectators attending, may serve to prove that the floor of an upper room. This practice is said to render apples more durable, by drying them .-But I can affirm this to be a mistake. Apples, the deep to flant THEMSELVES in the land. The long to the deep to flant THEMSELVES in the land. The long by a very rapid progression.

There were many fine specimens of agricultural ral products, &c. &c. which we propose to notice bereather.

The Worcester Agricultural ral products, &c. &c. which we propose to notice bereather.

Society—May we never forget that it is to that hereafter. they wither and lose their flavour, without acquiring any additional durability. The best mode of preserving apples for spring use, I have found to be, the putting them in dry sand as soon as picklayer. The singular advantages of this mode of treatment are these:-1st. The sand keeps the apples from the air, which is essential to their preservation. 2. The sand checks the evaporation or perspiration of the apples, thus preserving in them their full flavour-at the same time, any moisture yielded by the apples, (and some there will be) is absorbed by the sand; so that ed a desire to see in the Farmer, a comparative the apples are kept dry, and all mustiness is prevented. My pippins in May and June, are as fresh as when first picked; even the ends of the stems look as if just separated from the twig.

An English writer recommends the use of dry pit sand for the preservation of apples and pears. Glazed earthen jars are to be provided, and the capital embarked in the soil and labour employed sand is to be thoroughly dried. A layer of sand, in its cultivation. By reference to this document an inch thick, is then to be placed in the bottom every one may form some estimate of how much of the jar; above this, a layer of fruit, to be covor how little he contributes to the sustenance of year, can be had for seventy five dollars—or the an inch thick, is then to be placed in the bottom every one may form some estimate of how much ered with a layer of sand an inch thick :- then lay a second stratum of fruit, covering again with an inch of sand. An inch and a half of sand may be placed over the uppermost row of fruit. The jar is now to be closed, and placed in a dry airy situafrost. Wheat bran is sometimes substituted for

"One of the most easy methods (says Dr. Darwin,) of preserving fruit, is that of depositing it Maryland will take place at Easton, on Thursday in ice houses, where it may remain in a frozen and Friday, the 18th and 19th days of next month state for a considerable time. And if the fruit be afterwards gradually thawed, by covering it with melted ice, or immersing it in cold spring water, nesday morning, touch at Annapolis and arrive at melted ice, or immersing it in cold spring water, nesday morning, touch at Annapolis and arrive at melted ice, or immersing it in cold spring water, it will lose but little of its flavour, provided it be Easton about sunset. As many will be going, it consumed on the same day."

AGRICULTURE.

"TREATISE ON SOILS AND MANURES BY A PRACTICAL AGRICULTURIST."

IPMROVEMENT OF SOILS by the use of LIME. (Continued from our last.)

In number 28 of this volume, we commenced the cause, the treatise in its very nature, subdivides many insects are defended. to observe these natural divisions of the to picks treated of, and hence, in this number, though the general heading is continued, the Before th that object.

Without wishing to forestal or to influence the pay, he will now remit without delay.

VII. By applying Earths as Manures .- When dispensable. Closely connected with the theory of manures is the inquiry, What is the true food of plants?

"The chemistry of the more simple manures, the manures which act in very small quantities—such as gypsum, the alkalies (which include potash and soda,) and various saline substanceshas hitherto been exceedingly obscure. It has tive. It seems, however, a much more probable tino, and Davy have exposed the fallacies of this idea, that they are actually a part of the true theory. Every pound of rain water contains one food of plants, and that they supply that kind of grain of earth, besides other impregnations. Plants matter to the vegetable fibre which is analogous raised from Pure water will vegetate only a certo the bony matter in animal structures." The tain time, and never perfect their seeds. Bulbous That is, such as are proper to the plant; for

as manure.

1. Lime as a solvent. (Quicklime.)-Lime, when first burnt, has a caustic property, speedily decomposes vegetable and animal fibre, and is soluble in water. After burnt lime has been exposed to the atmosphere a determinate time, it becomes mild, by taking up carbonic acid; loses marles, and chalks, have no solvent action upon less they are too rich, or for the purpose of preits solubility; and becomes chalk, or carbonate

ced by pouring water upon it, when it heats violently, and the water disappears.

Slaked lime was used by the ancient Romans for manuring the soil in which fruit-trees grew. Nevertheless caustic lime is pernicious to vegetation, as far as it comes in contact with a growing bane in some marshes, moors, and peat landsrequires correction, proceed as under I, 1.

When quicklime, i. e. lime either freshly burnt or slaked, is mixed with any moist fibrous vegetable matter, there is a strong action between the two substances; and they form a kind of compost, time renders matter, which was comparatively inert, nutritive; and as charcoal and oxygen abound in vegetable matters, the lime is at the

Sida, and as such not remarkable for any peculiar qualities."

TALL MEADOW OATS.

Communicated by the Agricultural Society of the Valley, for publication in the American Farmer

Caroline, June 16, 1824.

Dear Sir,-As I promised, I enclose you as soon as it was ripe, a small parcel of the Highland Meadow Oat Seed, not knowing how to forward any, except in a letter. A very high eulogy of this grass, would not, in my opinion, exceed its merits. To prevent its growing in tufts, when sown broad cast, it is sown thick. To get into seed, this small parcel should be sown in drills, one foot apart, and only one seed as nearly as possible in a place, six inches asunder. The ground to be rich and well prepared, to be kept clean, and in case of dry weather, moderately watered. It is not proper for wet or reclaimed land. It is two or three years in coming to perfection. It suits well to mix with red clover. It easily sheds its seed, and watchfulness, to save it, is necessary. By cutting it for hay when the seed will partly vegetate, abundance may be saved with little trouble, provided the grass is shocked as soon as cut, not moistened with deworrain, over four small sticks two feet apart at bottom, and tied together at top with a wisp of hay, having a flue to this internal operture, made by a log to be laid down whilst the shock is constructing, and to be removed when it is finished. The log need only be about six inches diameter, taking care to increase the flue 481 lbs. rough fat from the entrails, &c. to a foot diameter when the log is taken out, by moving it about. By drilling the seed about the last of August, you will get in stock one year sooner. I sow it broad cast very thick with wheat in the fall, or with oats in the spring, mixed or unmixed with red clover. It should be covered very shallow; accordingly the wheat or oats being first ploughed in, the seed is then sown and lightly harrowed. The drilled seed should be covered about one inch. Kept moist, it will in warm weather be up in a week. Sown with wheat, it will destroy about half the crop. To oats it casionally grazed the same lots for sixteen years. without any top dressing, and without any material decay. It resists drought, cold, the tooth, the scythe, and the hoof, far better than any grass I ever saw. In saving the seed from hay, the latter should be moved as lightly and carefully as possible, to diminish the shattering of the seed as much as possible. More would have been said except

FOR THE AMERICAN FARMER.

BUFFALOE OXEN.

On the value of, with directions for breeding.

The animal known by the name of the Buffaloe I offered her to the butcher for sixteen dollars, throughout the vallies of Missouri and Mississippi, true that the Buffaloe goes twelve months with but he would not give more than fifteen for her-differs materially from the Buffaloe of the Old World. At first view his red fiery eyes, his shag-The first seven days her food was twelve quarts gy mane and long beard, the long lustrous hair tions, the hides are larger and applicable to a greael of clover hay, cut fine on the cutting box, which parative nakedness of his hind-quarters, strongly softer, and more impervious to water. The full was scalded with the bran, and given at twice, remind a spectator of the Lion.

In the size of his head, in bulk, in stature and fon; but the humps or protuberance between his shoulders, the shape of his head, his curled foremeal per day, with the jelly and hay as above, head, short thick arms and long hind legs mark a much stronger affinity to the Bison.

He carries his head low like the Buffaloe, and this circumstance, together with his short muscular neck, broad chest and short thick arms, desig-Twenty-six days she had four quarts of corn nate him as peculiarly qualified for drawing; the in the most advantageous manner to the weight She was fed forty-seven days, in which time drawn. The milk of the female is equal in quality to that of the cow, but deficient in quantity .- It has been supposed that the smallness of the udders is more remarkable in those that have the hump large, and that the diminished size of the hump is evidence of a more abundant secretion of milk. The hump when dressed, tastes like the udder of a cow and is deemed a delicacy by the Indians. But there is one other particular which distinguishes the Buffaloe of the new world from its eastern namesake more distinctly than butcher, who has followed the business a number any variety of conformation could do. The cow of years, said she was the first that he ever saw refuses to breed with the Buffaloe of Europe; and such is the fixed aversion between these creatures. that they always keep separate, although bred under the same roof and feeding in the same pas-ture. The American Buffaloe (on the contrary) breeds freely with the domestic cattle, and pro-pagates a race that continues its kind. Many of the landholders in Louisiana, like the Patriarchs of old, possess thousands of cattle which graze at liberty in the uncultivated prairies. These herds cost their owners little more than the trouble of marking them, and the expense of salting once or twice in a month to prevent them from becoming wild. By occupying the same pastures they have \$12 113 become so much intermixed with the Buffaloe, that it is difficult to say to which race they are most nearly allied.

In procuring the cross it is necessary to observe The flaxseed was put to soak in a can in warm one precaution. The domestic breed must furwater for two or three days, when it was put in a nish the male, and the Buffaloe the female. The The quantity of jelly each time was about twelve fect; but the pelvis of the cow is not sufficiently capacious to allow the passage of the Buffaloe's fætus with its hump. The pelvis is the circular bone which connects the spine with the thigh bones, and when the fœtus fro.n disease, or any other cause, is too large to pass through it, the female must necessarily die in labour. This fact constitutes the principal obstacle to the introduction of the half breed in the old settlements. It would be easy to catch and tame a single male of the wild breed, and to obtain any number of impregnations from him; but it is difficult to procure, and still more so to confine a sufficient number of wild females. The amazing strength of as she was thriving very fast. I think the addi- the head and breast enables them to overset the strongest fences by running against them; and unless they are caught very young they can never be effectually tamed. Nevertheless, some enterprizing farmers in this State and Missouri are introducing the breed. Captain Jenkins, of Rutherford county, has one three years old and one two years old of the half blood, and several calves of the quarter blood, all of which are large for the a age, and promise well. The advantages proposed by the introduction of this breed are, that the oxen thus raised will be stronger, less sluggish, more hardy, and more easily kept, and (if it be young,) they will probably last longer than the common breed. In addition to these consideragrown Buffaloe on the Missouri are said to be

IslucCourse, at Jamacia, by two three year old colts; named Lawrence and Brown. It was who should southern education and habits, in the person distance was 4 miles and repeat; each colt to cary the performance was as follows:—
125 pounds weight; Count Pifier was rode by Mr.

MR. LAWRENCE. Laird, who bred him, and Lance by Mr. Purdy. More skilful riders, perhaps could not be found in the United States. The result has shewn that colts of this age can perform more than the breeders of horses or sportsmen have been ac-customed to believe. Ninety pounds, by the English rules of coursing, are the weight agreed upon for three year olds,—and 98, by the rules of our course, at Jamaica; and then seldom do they run more than two mile heats at that age. In this match the first 4 mile heat was run, each colt carrying 28 pounds over the usual colt weights, in eight minutes and twenty five seconds, which is a greater performance than any thing we have yet seen on record in the English sporting calenders. They started kindly at the tap of the drum, Pur-vered from Piscataway Inspection Warehouse, dy taking the lead, but was passed by Laird in during the quarter commencing on the 5th July, the first half mile. In the next half mile Purdy 1824; ending on the fourth October, 1824. regained the ground he lost, passed Laird, took the lead and kept it until they had entered upon the fourth mile, when Laird suddenly made a run, shot ahead and maintained his superiority to the end of the heat; coming in about three lengths ahead of his antagonist, notwithstanding all his active and persevering exertions. Second heat, Laird took the lead and kept it with ease to the end of the race, winning about four lengths-time 9m. 30s. Both colts run remarkably true, and shewed great strength, bottom and speed. Should no accident happen to them until they become aged horses, they will be able to contend with any in this office. thing that can be produced upon the turf.

Seven pounds is considered equal to a distance. As the colts carried 27lbs, over weight, there were 4 distances against them. Upon this calculation it is greater running than that of Eclipse and Henry.—Aew-York Paper.

PENNSYLVANIA AGRICULTURAL SOCIETY.

The second annual exhibition of the Pennsul vania Agricultural Society was held on the fourteenth and 15th instant, at Chester, in Delaware

The usual arrangements being made, the various committees proceeded upon their duties, and presented the following reports, which were, by

the directors, confirmed.

Mr. Worth delivered an excellent address. The Society afterwards assembled on the ground, where they were gratified by receiving the presidents and officers of the Franklin Institute, of the Philadelphia, Bridgeton, New Brunswick, and Bucks county Agricultural Societies, as well as many distinguished gentlemen from Delaware, John Hare Powel, for the best buil of Durham Carolina, Maryland, and other States.

The committee for neat cattle report that they consider the following persons entitled to premiums:-

John Hare Powel, for the best bull not more than six, nor less than two years old, \$40, for Bishop, an imported thorough bred "improved Durham short horn bull," bred by Mr. Curwen of Cumberland. Premium relinquished by Mr. Powel.

Thomas S. Woodward, for the next best, \$20, for Oakes, from a native cow by Cœlebs, an im-

ported improved D. S. H. bull.

Henry A. Carpenter, for the next best, \$10, for Lothario, bred by Mr. Powel, dam Rosc, an "imported D. S. H. cow, by George, an improved D. S. H. bull."

Manuel Eyre, for the next best, \$5, for Leopard. bred by Mr. Eyre, derived from Mr. Heaton's importation of Teeswater blood. Premium re-

linguished.

John Hare Powel, for the best bull not more than two years old, \$25, for Wye Comet by Blaze, dam White Rose, both bred by Mr Champion, in England. Premium relinquished.

John Hare Powel, for the next best, \$15, for Sussex, bred by Mr. Powel, sire and dam both bred in England. Premium relinquished.

Henry A. Carpenter, for the next best, 310, for Leopold, bred by Mr. Carpenter, from Rose, by Mr. Powel's half bred bull Rob Roy.

John Hare Powel, for the next best, \$5, for Rake, bred by Mr. Powel, by Bishop, dam Flora, an imported D. S H. cow. Premium relinquished.

John Hare Powel, for the best cow, not more than seven, nor less than three years old, \$25, for Shepherdess, a thorough bred improved D. S H. cow, bred by Mr. Champion, in England .-Premium relinguished.

mal we have ever seen.

SAMUEL WEST, JOB ROBERTS, WILLIAM EVANS, ELIJAH LEWIS, SAMUEL DAVIS

Committee on Sheep

The committee for Horses report, that they consider entitled to premiums,

Callender Irvine, for the best bred stallion, not less than three years old, \$40, for "Windflower." Premium relinquished by Mr. Irvine. Jacob Taylor, jun for the best stallion, fit for

draught, not less than three years old, \$40, for "Black Planter Lyon." Premium relinquished. John Taylor, of Montgomery, for the best colt, ten dollars.

The committee have to regret that no premium had been offered for a description of horse, calculated for the general use of the country, for carriage and gig; and the more so, as one of this character was exhibited, of superior form and excellence, called Diomed, and owned by Mr.

In recommending the award of the above premiums, the committee have felt no small degree of diffidence. The claims of several of the horses were of the highest order. In point of action, figure and breeding, Buzzard, Godolphin, and Rattler, are entitled to marked distinction. Arab, by Grand Bashaw, and Standard, by Sir Solomon, three years old colts, bid fair, in due time, to assume their station among the first bred horses of the country. In noticing "Bolivar," it is sufficient to say that he was sired by "Windflower." Mr. Kersey's horse "Hickory" shows many of the marks of the fine stock from which he is descend-

In recommending the award of the premium to "Black Planter Lyon," as the "best stallion fit for draught," the committee are by no means insensible to the merits of the other horses of that class which were exhibited; they are equally creditable to the breeders and to the country: among them, however, it is deemed proper to distinguish Mr. Bennet's horse "First Consul," and Mr. Kersey's " Chester County Bay."

Grand Bashaw, who took the premium at the first exhitbion, was viewed with great satisfaction, and lost nothing of his former character by his presence on this occasion.

MANUEL EYRE, GEO. BLIGHT, E. MORRIS, JNO. G. WATMOUGH, JOHN WILCOX, AL. SYDNEY LOGAN, Committee for Horses.

The following horses were, in addition, exhibited :-

Mr. Kendig's powerful and very active draught horse Complanter.

Mr. Davis's Planter Lyon, which last year took the premium for the best draught horse, and was therefore excluded from the competition.

IMPLEMENTS OF HUSBANDRY.

The committee for implements of husbandry report, that they consider the following persons entitled to premiums :-

Oliver Evans, for the best plough, Wm. S. Michener, for the best winnowing mill or

Your committee beg leave to state, that they consider Ezra Cope and Thomas Hoopes, jun. entitled to a medal, for their improvement of the

blood, which we consider the best grass fed ani- mowing machine, which, notwithstanding the un- Mrs. Jona. Roberts for the best counterpane, \$5 been decidedly proved to be worthy of distinction, as well for the singular simplicity and ingenuity of its construction, as for its rapid and effective operation. For Mr. Eastman they would recommend the award of a copper medal, for his straw-cutter, which has been so often noticed on similar occasions, that there is scarcely room for their commendation.

AMERICAN FARMER.

Although Oliver Evans has been considered entitled to the premium for the best plough, they are not unmindful of the admirable and well tried plough of Mr. Suplee, and the ingeniously and well constructed ploughs manufactured by Mr. Wiley, Mr. Beach and Mr. C. Evans.

They cannot avoid noticing a churn, produced by Mr. Haydon, of Trenton, as it appears to combine with other advantages, that of being easily made clean.

A neat model of Mrs. Griffith's improved beehive was exhibited, which appears to be well fitted for its purpose.

Voted, That the President be requested to communicate for publication, the remarks made by him, previous to announcing the names and duties of the several committees, at the Cattle Show, yesterday."

Attest, BENJ. GUILD, Assist. Rec. Sec'y.

REMARKS OF THE HON. MR. LOWELL.

Soon after the first establishment of this annuit proper to excite the public attention by an annual Address. It seemed to be necessary to vindicate the establishment of such a celebration and Show, and to awaken the attention of our Farmers to the importance as well as to the defects of their interesting pursuit. Our fellow-citizens, desire of being aroused and instructed. Our country, from its very constitution, its reasoning and thinking habits, demands on all such occasions intellectual exercise. No nation, if we except ancient Greece, was ever so much addicted to the pleasures of the understanding. If their ings without speeches, orations, discourses, or sermons. To be sure, it must be admitted that some of these productions are often of inferior universal relish for intellectual enjoyment. They are the best possible proof of a general thirst for knowledge. If these productions are sometimes indifferent, they are censured or forgotten But whether good or bad, they accustom our citizens to think and to reason, to condemn or to praise.

It has been found however by experience, that there is neither the necessity, originally presumed, for such addresses upon this occasion, nor the time requisite for them, consistently with the laborious duties of the day. It is no longer necessary to justify these exhibitions, since fifty millions of men in Europe and America have sanctioned them by their adoption If public opinion is any test, (and we can scarcely find a better in an enlightened age,) it is now settled, that these exhibitions of agricultural productions and of manufacturing skill are eminently useful.

To the ancient world,-to Greece and Rome in their best days, -such exhibitions were entirely unknown. How could it be otherwise when the Farmers were slaves, whose condition was very little better than that of the black population of the West India Islands! The knowledge of the agricultural art was confined to men of wealth and letters. They dictated to their overseers, what course of industry their slaves should purue. It is not more than half a century since the first experiment was made in any part of the world, of giving a stimulus to agricultural and

mechanical efforts, by public Shows and Rewards.

There are at this day nearly as many public Shows in France, as there are departments,about ninety,-and there is, once in three years, a grand national exhibition at Paris, the list of whose premiums fills an octavo volume of 350 world! England has not so many, but they are cesses of agriculture. numerous, and quite as efficient; and the United States have at this moment nearly fifty public ex-hibitions of this description. And the trustees of cal men. Who introduced the Potato into Eu-tury. If we have the patience, skill and care of the various Societies embrace some of the ablest rope, which now furnishes subsistence to many the Saxon farmers, we may in another half cen-

utility.

easily show, that their effects have been fully as blessing ever bestowed on our country. ted by these exhibitions, than by all the writings al festival, the Trustees of this Society deemed of cultivators from CATO and COLUMELLA to constitute so large a part of our productions, in EVELYN, DUHAMEL, and Young. Yet we would the most improved States of our Union? not be understood to undervalue their services. much more intimate, than mere practical men are willing to admit, or than some of them com can, the instrument, and to NEWTON and KEPLER. not have performed in a hundred hours.

merit, but they still serve to stimulate the almost ments of science to enroll. There is no short mode of making the earth productive, and of saish the number of persons devoted to that great class of citizens devoted to the most healthy emtions, and one which necessarily provides in every useless. state a healthy, vigorous and uncorrupted population.

> It would seem to my mind, I say it with diffi ploying the greater number in the innocent and expence to the publick. untempting pursuits of agriculture. Such has as under one so truly republican as our own.

But though agriculture has not experienced any of those great changes, which have totally overthrown the old means of industry in the other occupations of man,-although we can neither plough nor sow by steam, nor by the novel com binations of the mechanick powers, yet agricul-ture owes much, very much, to men of philosophi-peculiar benefit from their introduction. A strong cal research. Agriculture has always been much example of public spirit in our predecessors, most more of a science, than our farmers are ready to of whom are gone. believe. They sometimes sneer at "book-learning;" and it is precisely because they know too progress of this valuable race was slow, offered little of the history of their own art. The better liberal and expensive premiums for the introducpages! What strong proof of their supposed uti-lity, in one of the most enlightened nations of the will pay to philosophical inquiries into the pro-mediate effect was, the importation of numerous will pay to philosophical inquiries into the pro-

TO THE

CITIZENS OF THE UNITED STATES,

Whether Farmers, Planters, Mechanics, Manufacturers, Merchants or Traders, without distinction of section, party, profession, or occupation.

FELLOW CITIZENS,-

You are all deeply interested in the welfare progress in Agriculture has been full as extraor- of our common country-and therefore the foldinary. This Society put forth, 20 years since, a lowing memorial, which involves considerations set of queries to farmers in various parts of the of vital importance to the nation, is respectfully state, touching every branch of farming, and the submitted to the consideration of all classes of soquantities produced of every description of agriciety, without distinction. Should its contents be cultural products. The answers are in print, and found to be correct, it is recommended to call town are most valuable documents. These replies, and county meetings in your several states, to take the subject into consideration; and have the will prove, that the advancement in that art has memorial circulated for general signature, and opportunity to come to this country of freedom. will prove, that the advancement in that art has been inconceivably great. The highest crops of potatoes were then stated at 200 bushels. We potatoes were then stated at 200 bushels. We their ensuing sessions. This will elicit a mass of valuable information, and fully ascertain the extent to one part of the State, but to many portions of the State, but to many portions of ingly uttered in various memorials and petitions, and palpable truth, that almost every branch of industry languishes. We beg it, for the raising of from 400 to 600 bushels per ingly uttered in various memorials and petitions, acre. The highest quantity of corn raised upon and likewise in Congress by Mr. Carter, Mr. Tatthe acre was formerly stated to be from 40 to 45 bushels. We have had almost innumerable claims for the production of from 65 to 116 bushels. Jam aware of the objections urged, that there lessly under it, as so many fatalists, without any may have been over estimates, and that these effort at amelioration, or whether the energies of

the said State,
Who beg leave respectfully to submit to your turnip, the common turnip, the common beet? serious consideration the following important parts, and flour at \$2.25 per barrel. Nearly all

> This country possesses advantages, natural, might say never equalled, in any other nation, an-

1. It has a most extensive seacoast, studded with rich supplies for our milch cows, oxen and with capacious harbours, and every convenience

2. It is intersected by some of the most magni-

3. Our soil abounds with iron ore and coal, two of the most important of the fossil productions of

4. Of cotton, the most valuable raw material ca, and have a capacity to produce enough to supply the whole world.

5. Of lead, copper, and timber, we have a su-

perabundance.

6. We have the capacity to produce silk, flax, most wants

7. We enjoy water power to a boundless ex-

8. Fertile lands may be purchased here in feesimple, for less than the tithes paid in many parts lick notice, that no valuable effects will follow The Geniting, Cattern-and Minot, and Iron of Great Britain and Ireland, or the poor rates

9. Our population is hardy, enterprising, energetic, and intelligent.

10. We are wholly free from the burden of

11. Nine-tenths of our farmers and planters

12. We have almost every variety of soil and

climate. 13. Our government is among the most unexpensive in the civilized world, regard being had

to our population.

14. We enjoy liberty to an extent that cannot

be exceeded.

15. There are none of the galling restraints upon industry or talent here, which prevail in most parts of Europe. Every man may practise any where whatever trade, occupation, or profession he pleases.

16. Our national debt is less in proportion to our resources and population than that of any other nation in the civilized world-not being above nine dollars per head-only two-fifths of the annual revenue of Great Britain, and only about four fifths of her excise.

17. We have ample space for all the distressed

leave to enumerate in detail some of the lead ng features of the situation of our country, which we shall do as concisely as possible. As some of the facts of the following statement have been controverted, we deem it necessary to establish them by what we hope cannot but be regarded as amply adequate testimony.

1. From the excess of the productions of farming, and the pernicious exclusion from the ports of Europe of our bread-stuffs, on which depends the prosperity of so large a portion of our population, probably 6 or 7,000,000, the prices have sunk so low, at a distance from the seaboard, as not to remunerate the farmer for the labour and capital he employs in cultivation. Corn and oats are sold at 124 a 20 cents per bushel in various the other productions of farming, and those of horticulture, are sold at equally reduced prices.

"The farmer of the grain growing States will "tell you, that HE HAS LARGE ANNUAL "SURPLUSES OF GRAIN, WHICH HE IS "DOOMED YEAR AFTER YEAR TO SEE "ROT AND PERISH ON HIS HANDS; that "it is to no purpose that he applies himself to the "diligent cultivation of a fruitful soil; that each "smallest earnings, and anxious for their bread." " return of autumn finds his barns filled, to over-" flowing, with abundance; but that it is all use-"less, nay, worse than useless to him: for his " frustrated, and the bounty of his fields most cru "elly wasted. 10. This reduction, which nothing but the disress and impoverishment of the Western country could have rendered necessary, impaired the national resources to the amount probably of about 150,000,000 dollars. It further reduced the value of all the lands which Congress had previously sold, and which had been bona fide paid for, amounting to many millions of acres, to the great injury of hundreds of citizens.

(To be concluded in our next.)

DISEASES OF DOMESTIC ANIMALS

AND THEIR CURE.

Scouring .- A scouring or purging, is a common "The mercantile embarrassments of the coun- disease among all our domestic animals; and in some, it is dangerous, and very difficult to cure. Under the article Diarrhæa, I have noticed the disease as it affects horses: but in cattle, this purging has continued long, it produces general weakness and loss of flesh. The animal becomes hide-bound, and has a rough staring coat. The dung is thin and slimy, and in bad cases, air bubbles arise on its surface. The disease appears to arise from the animal being overheated in driving, and particularly by being suddenly cooled when in this state; and by want of sufficient nourishment, especially in milch cows. Taking the animal in, is the first step towards a cure. The diet should be nutritive, consisting of oatmeal or wheat to be an acrid kind of bile formed, which probably is the principal cause of the disease, and depends on a morbid action of the liver, it will be proper to give, for two or three mornings successively, a dose of some mild mercurial with a little rhubarb and castor oil. During this time, wheat flour gruel should be given several times a day. The acrid bile having been got rid of by these means, a few doses of astringent medicine will probably put a stop to the disorder. When the scouring has ceased, the animal should be brought gradually to her former habits, taking particular care that she is not exposed to rain or cold winds, or put into wet pasture. It should have been observed, indeed, that as the disease is

Shoeing .- In shoeing a strong well-formed foot little narrower and thinner. That surface of the shoe which bears on the ground, should be perfectly flat; that next the foot, particularly to-wards the toe, should be a little hollowed; for low the purchasers of public lands, who owed the even in good feet, the sole towards the toe is oft-government 21,908,099 dollars, to relinquish them en as high as the crust, and consequently would they judged proper.

A very spirited effort has been lately made to revive the Sports of the Turf in this State, with an express view to the improvement of the breed of horses-but that effort has been as we may soon shew, ill directed and ill supported. In the mean time, the spirit for such amusements is reviving in the Country, and therefore without in any manner neglecting the great objects and duties of this journal, we shall give a portion of it to record the result of trials of speed, as well as of skill, in other sports-taking special care always to keep clear of, and to reprobate gaming, cockfighting, and milling.

For those of our readers who take an interest

in the subject, we subjoin the following, which may be considered as authority, in explanation of the terms and the Laws of Hacing, "according to the modern English practice," as the Lawyers say.

LAWS OF RACING.

Houses take their ages from May-Day, i. e. a horse foal-ed any time in the year 1823, is one year old on the 1st of

Four inches are a hand; 14 pounds a stone; 240 yards a

Catch-weights are, each party to appoint a person to ride without weighing Feather-weight signifies the same.

Give-and-take Plates, are weights for inches; fourteen hands to carry a stated weight, all above or under to carry

extra, or be allowed the proportion of 7lbs to an inch.

A Whim-Plate, is weight for age and weight for inches.

A Post- Match, is to insert the age of the horses in the articles, and to run any horse of that age, without declaring till you come to the post to start.

Handicap weights are, weights according to the supposed

Plates or shoes are not allowed in the weight

The horse that has his head at the Ending-Post first, wins

Riders must ride their horses back to the Winning-Post to veigh; and he that dismounts before, or wants weight, is

If a rider fall from his horse, and the horse be ridden in by a person of sufficient weight, he will take place the same as if it had not happened, provided he went back to the place where the rider fell

Horses not entitled to start without producing a proper certificate of their age, &c. if required; except where aged horses are included, in which case a junior horse may start without a certificate; provided he carry the same weight as an aged horse.

or the best of the Plate, when there are three heats run. the horse is second that wins one. For the best of the heats, the horse is second that beats the other twice out of three times, though he doth not win a heat.

bPfi gce attfcotch neight

When a Plate is won at two heats, the preference of the horses is determined by the places they hold in the second

When three horses have each won a heat, they only must start for a fourth, and their places will be determined by it, there being before no difference between them. No distance in a fourth heat.

In running heats, if it cannot be decided which is first, the heat goes for nothing, and they may all start again, except it be between two horses that had each won a heat. Horses

does not start again, is no bet.

A confirmed bet cannot be off, without mutual consent.

Either party may demand stakes to be made, and on refusal may declare the bet void.

I a party be absent on the day of running, a public declaration of the bet may be made on the course, and a demand whether any person will make stakes for the absent party; if no person consent to do so the bet may be declared void.

Bets agreed to be settled in town or any particular place, cannot be declared off on the course.

The person who bets the odds, has a right to choose his horse or the field. When he has chosen his horse, the field is what starts against him; but there is no field unless one start with him.

If odds are bet without mentioning the horse before the race is over, it must be determined as the odds were at the

time of making it.

Bets made in running are not determined till the Plate won, if that heat be not specified at the time of betting.

Bets made between particular horses are void if neither of them be the winner, unless specified to the contrary.

At Newmarket if a match be made for any particular day in any meeting, and the parties afterwards change the day, all bets must stand; but if altered to a different meeting,

all bets must stand; but it altered to a different meeting, bets made before the alteration are void.

Bets determined, though the horse does not start, when the words "absolutely," "run or pay," or "play or play," are made use of in betting. For example, I bet that Mr. Udny's ch m. Mirandola, absolutely wins the King's Plate, at Chelmsford, in 1824. I lose the bet though she does not start and only in the control of the c at Chemistori, in 1824. I fose the bet though she does not start, and win though she goes over the course alone.
All double bets are considered as play or pay.
Since Epsom Races, 1822, all bets are made in pounds, and not in guineas, as formerly.

Horses running on the wrong side of a post, and not turn

ing back, are distanced.

Horses distanced, if their riders cross or jostle.

Horses that forfeit are the beaten horses, where it is run

or pay.

Bets made on horses winning any number of plates that year, remain in force till the first day of May.

Money given to have a bet laid, not returned if not run.

All matches, bets, and engagements, are void on the decease of either party before determined.

An untried stallion or mare, is one whose produce had not started in public at the time of closing the engagement.

started in public at the time of closing the engagement.

In estimating winnings it is the practice to consider the clear sum gained only, and consequently to exempt the winner's stake. A winner of a sweepstakes of 20 gs. each, (3 subs.) is, therefore, not disqualified from running for a 50% plate, expressed to be for horses that never won plate, match, or sweepstakes, of that value.

PARTRIDGE SHOOTING-Commenced.

See how the well-taught pointer leads the way,
The seent grows warm; he stops: he springs the prey;
The fluttering coveys from the stubble rise, And on swift wing, divide the sounding skies; The scattering lead pursues the certain sight, And death in thunder overtakes their flight.

A match at killing partridges we understand was shot last week at WAVERLY, on Elkridge, between George Patterson, Esq. and Col. Hind-man, on one side, and George Howard and J. Ridgely, Esqs. on the other.—Mr. Howard generously abandoned his own grounds to his guests, taking his partner over the neighbouring fields of "the Manor." The whole number of birds, bagged, was 86. The match was won by Mr. Patterson and Col. Hindman, who hunted on the fields of Waverly. Gentlemen who are beaten generally have some ready excuse; so in this case, the losers allege that their sport was spoil ed by the ill conduct of some ill-broken dogs of a neighbouring gentleman that joined them in the hunt.—We are glad to see an increasing taste for rural sports arising amongst the gentlemen gust 9, in the safest ground in England, the enclo-of the country. They lead our young men of the sures at the Red House, Battersea. The Chelsea town too, at leisure times, away from the vicious candidate was a gentleman of the name of Coke, a real enjoyment, that a confirmed smoker shall haunts of a populous city, into open fields, where and that of Middlesex, a Mr. Cottrel. The shoot be blind folded after taking three whiffs; and let haunts of a populous city, into open fields, where and that of Middlesex, a Mr. Cottrel. The shoot be blind folded after taking three whiffs; and let no man ever contracted dyspepsia, or imbibed an ing was nearly equal, Mr. Coke having won by ling was however to test one bird only. Mr. Cottrel evidently lost two birds by their dropping out of bounds. The win he shall not know whether his pipe is a light of much, at this season, in England; where each ner killed twelve from fifteen. Mr. Willoughby, otherwise!—Economist.

from a trap, and to those who have not read birds each. The former killed six and his adver-accounts of these matches, the small number of sary five. birds which escapes the quick eye and steady nerve of the practised gunner, is truly surprising. For the amusement of our young sportsmen we subjoin accounts of some of these matches, taken commonly steady, or mischief will ensue, and from the September number of the "Annals of consequent vexation to the sportsman. Where from the September number of the "Annals of consequent vexation to the sportsman. Where Sporting," received in exchange for the Amerithere is an abundance of game, one dog will be can Farmer

Pigeon-shooting .- New Hats and Ashton clubs. The last of the crack-matches between those celebrated Clubs, took place, on Monday and Tuesday, 15th and 16th of August, on Fairfieldheath, between nine members of each, at seven pigeons each, for two hundred sovereigns a-side; two ounces of shot, and the bird twenty-one yards from the gun. Some excellent shooting took place, and it was a close match, as the following statement will show :-

In partridge-shooting, it will generally be found that two good pointers are sufficient in the field at one time; if more be used, they should be unfound sufficient.

Pedestrianism.—During the first week in August, a young pedestrian, of the name of Bullock, undertook to walk seventy-five miles for two suc-cessive days. The ground chosen was between Cheltenham and Shurdington. He started from the Lamb Inn, and on the first day walked eighty miles with apparent ease, completing his undertaking on the second day, almost as fresh as when he started.

Trotting match for 200 sovereigns, at Ashford.
-Captain Dalrymple undertook his match, to drive twenty-eight miles in two hours in harness, seven out, to and fro. The machine was a lofty newly constructed one, built for the purpose.— The horse is something under sixteen hands, and the seven miles were done as follows: The first seven in twenty-nine minutes thirty-six seconds; the second in twenty-nine minutes thirty-eight seconds; the third in thirty minutes two seconds, the wheels having been backed for breaking into a gallop; and the fourth, completing the twentyeight miles, in thirty minutes five seconds. Total, one hour fifty-nine minutes twenty-one seconds. He was backed to win at five to four.

An extraordinary mare.-Wednesday, 11th of August, a black mare, about fourteen hands high, was rode the distance of fifty miles in four hours and twenty-five minutes, (the time allowed being five hours and a half,) having been purchased only two days previous at Wadley fair. She performed the first twelve miles in fifty nine minutes and thirty-eight seconds; the second twelve in sixty minutes twenty-two seconds; the third 12 in sixty minutes fifty-eight seconds; and the fourth twelve in seventy-four minutes two seconds; and the last two miles in ten minutes; having one hour and five minutes to spare, -Although not in good condition, she did not appear the least distressed. This feat was performed on the Ashton Club, at the close of the first day's the Banbury road, the horse starting from the shooting, but the third and fourth shots on each Pheasant, in St. Giles's, Oxford. MASSACHUSETTS AGRICULTURAL SOCIETY.

REPORT No. I.

Calves, beg leave to report, that it was with much used to be sent to them, because they were much regret, they perceived but one competitor for the thought of in a remote circle. -On this occasion premiums for fat cattle. It is indeed extraordi. the bulls were very fine-and the difficulty of senary, that in this grazing State, and in a market lection was of course increased. To decide beso well supplied as that of Boston, with the choic- tween two animals of the finest proportions, is of est beef, such a case should ever occur. We course embarrassing, and it is very possible, that are persuaded, that it arose from a general but no other three persons would select precisely the very erroneous impression, which we have taken same three animals. One fine point would strike all the pains in our power to eradicate, that our one individual, and another would make an impremiums are given to heaviest animals, and pression on a second. There is however one sathat it is in vain to compete where it is known, tisfaction in such a case, that you are sure the that very extraordinary animals are to be sent. choice must fall on a good one. The experienced It was probably well known to the Western Gra-ziers, that the two fine cattle from Shrewsbury tain knowledge, anxiously examined every animal. were to be offered, and they presumed that they but just praise to say of them, that more candid carry the two first premiums.—Nothing but just praise to say of them, that more candid could be more erroneous than this opinion, and it and more upright men could not be appointed to the interests of perform such an embarrassing duty. With these is an error of great moment to the interests of perform such an embarrassing duty. agriculture .- Let it then hereafter be distinctly necessary and proper explanations, the Commitunderstood, that we have repeatedly granted pre miums for fat cattle weighing 1800 pounds to the bull, to Benjamin Harrington, of Princeton, 18 exclusion of others on the field which weighed months old, of the Holderness and native breed, 2000 and upwards. Our principles are, to give the premium for fat cattle not to weight only, but upon a combined consideration of form, apost a native breed, from Westminster, called very 2000 and upwards. Our principles are, to give titude to acquire flesh, distribution of that flesh, improperly the Yorkshire breed. There is, I bein the parts, which are most valuable for food, lieve, no colour for this appellation. It is a small and smallness of offal. We take into considera-tion also, the mode of feeding. Other things most remarkable for the delicacy of its limbs equal, we give the preference to those which the roundness of its carcase-its disposition to fathave been worked till within a short period be ten, and especially the almost unnatural size of fore they are offered. I undertake to say, that a its hind quarters. I cannot withhold my personal fine fat heifer weighing 1000 or 1100 pounds—or doubts, about the utility of propagating, too exa fine steer of equal weight, whose forms were tensively, a race so very small. It is remarkable, beautiful, whose flesh was profitable, and whose that they preserve these characters and marks in cost of fattening had been small, would have whatever quarter of the country they appear. stood a fair chance of gaining one of the premi There was a beautiful bull of Mr. Boylston's, of ums against these fine large sized cattle. The Princeton, of the same breed, and another of the real object of Agricultural Societies is, as it ought same race, of H. G. Buttrick, of Westminster, a ment of our own stock than from importation. to be, to encourage the most profitable and least town, from which the first bull of this race was expensive mode of preparing fat cattle for mar-several years since, sent to our Show.

that his oxen were of the first class, as to form, the quantity of milk she gave. It was stated by and useful flesh and tallow. They were excel-the attendant, who exhibited, that his dam had lent, and would be distinguished at any show in given from 20 to 30 quarts per day. It is well any country. To the honor of the candidate we known, that she is very much distinguished as a would remark, that they were raised by himself, milch cow. and were a fair sample of his own stock.

Although no one entered the lists with him, they were animals which fully deserved a prize. We award therefore to Seth Wyman of Shrews-

bury, the first premium of 25 dollars for his yellow ox, weighing 2452 pounds at 7 years old.

And the second premium of 20 dollars to the

same person for his brown ox of the same age, weighing 2469 pounds. In this case, it will be observed, that we preferred the smallest ox, and other as to form. we have no doubt the butchers and consumers will prefer him.

We now come to the consideration of a part of finest points of his sire. our exhibition in which it is very difficult for the Committee to say whether pleasure or pain hibited by J. W. Hubbard, Esq. of Worcester. predominates or prevails—The pleasure regards There were difficultie the hublic, the pain themselves. It was truly rassing, as to bull calves. grateful to those of us who have looked forward, as we have done, to the rapid improvement of bull calf to Nathan Nicols of Malden, from Coelebs, but I trust that the confusion of the day, and the our stock, to hear all our numerous visitorsbouring, and distant states-and others from Eu-bury-1 Coelebs-1 Fill Pail-and 1 Native.

rope, speak in terms of the highest commendation of the exhibition of our bulls, and their young progeny, male and female. Out of thirteen bulls from Bakewell. on the field, there was not one which could be tee award the premium of 30 dollars for the best

ket.

The third premium of ten dollars was awarded
Having made these remarks, we owe it to the

many from our own State, others from neigh- of 10 dollars, to Nathan Peirson, of West New- are introduced to the Society, will be admitted as

The third premium to the Hon. John Wells, 5 dollars, for a bull calf from Holderness, Cœlebs,

We ought to observe that Mr. Wells exhibited called ordinary. These Shows have utterly ba- a fine pair of twins, a bull calf and heifer, from nished that race of thick necked, and lean quar- Cœlebs out of a Bakewell cow, and one or two The Committee on Fat Cattle, Bulls, and Bull tered animals, of great but bad proportions, which other fine heifers, of which, being Chairman of the Committee on that description of Stock, he could take no notice.

Mr. Prince presented a beautiful bull calf La Fayette, being almost wholly of French breed, -Alderney and Norman. This race is not remarkable for flesh, but valuable for milk.

On the whole, it must be obvious, that Cœlebs has done much towards the amelioration of our cattle -His progeny are certainly fine.-If Denton and Holderness do not exhibit as many at the Brighton Show, it may be, and probably is, owing to their location-It is too far to send them. Yet a Holderness, if will be seen carried the first preminm, and neither of the Committee who decided, knew of what breed he was. This suggests to me the propriety of concealing the breed of the animals offered, till after the decision.

The animals presented by Admiral Sir Isaac Coffin were exhibited together. None of them except Admiral have yet had progeny—One of his calves, now owned by Mr. Derby of Salem, gives us a right to expect, that he will be a most valuable addition to our Stock.

The Herefordshire breed sent by Sir Isauc Coffin, is highly esteemed. It is certain that the heifer of that breed sent Admiral Coffin, is one of the most beautiful animals ever exhibited at our Shows.

Mr. Prince exhibited a North Dover Bull, probably of the same race with those which received so much praise from the Worcester County Society. On the whole, we have every reason to believe that we are in a fair way to improve our own native breed, not only by selecting the best of them, but by the propagation of those which have been most approved in Europe .- I repeat what I have often urged on this occasion, that more is to be

JOHN LOWELL, Chairman.

Note -From haste and indisposition, I omitted to notice several fine animals sent for exhibition only. If designed, this omission would have been unpardonable, since the Society and the publick are much indebted to gentlemen, who, at their own expense, send fine objects, whether of nature or art, in order to increase the interest of our Show.

Gorham Parsons, Esq. exhibited the fine Alderney Bull, given to the Society by Mr. Hubbard, and bought by Mr. Parsons, of the Society. He is much improved, and is a fine specimen of this valuable race. He exhibited also another fine bull and heifer of his own raising.

Col. Jacques, with his accustomed zeal exhibited Cœlebs, Yankee, and several other of that fine race, who are always sure to attract attention.

John Prince, Esq. exhibited a fine calf from Admiral, shewing that his stock are fully worthy of the reputation of the Teeswater race.

There was a most beautiful bull of the same race imported by George Lyman, Esq. and sent for exhibition. We could not perceive that he for exhibition. There were difficulties, though not so embarassing, as was inferior in any point to the best of the breed.

It is quite possible, that 1 may still have overlooked some which ought to have been noticed, The second premium for the next best bull calf, attention I am obliged to show to strangers who a sufficient excuse.

REPORT No. II.

The Committee on the subject of Agricultural Implements and Inventions, Report:-That six cast steel Hoes were entered by Z. and F. Bisbee, of East Bridgewater, in the county of Bristol The invention consists principally in the eye of the hoe, which passes through the plate of it, and is rivetted all round, instead of on two or three sides, as in the common hoe.—This conformation gives many advantages as from inspection is apparent. Their cost is seventy-five cents. Mr Bisbee produced certificates that they had been used and approved by practical farmers, and were considered cheap, compared with other hoes, at that price. Considering the importance of the instrument, and the apparent utility of the im provement, the committee recommend a premi-

An iron Bit Stock was entered for premium, by Eleazer Smith, of Walpole, in the county of Norfolk. The instrument exhibited was extremely well finished, and displayed great inge nuity and excellence of workmanship, Its advantages were stated to be-that, being of iron, it was less likely to be twisted off by hard ser vice-that the end of the stock, where it turns, is of tempered steel, to prevent wear by using turning on a centre and neck of hardened steel; enclosed by a sort of box of iron, screwed together, so as to contain oil and a piece of iron, called the breast piece, which is applied to the breast or hand, in using, and which contains a screw of steel, for the centre to turn upon; the other end bearing by a sort of lip, on the back of the yoke, of this centre or stem is all of steel, and let into which can only work one way-and also in a the stock by a square hole through it, with a nut countersunk, so as to fasten that part togetherthe object aimed at being durability, ease of repair, handy use, and preservation of the oil. All though the alteration is very simple, yet in the these advantages, the committee apprehend, the opinion of your committee it is very important, be afforded to be made for five dollars, and even cheaper than English steel bit stocks, it is a valuable improvement. Under all six a valuable improvement. luable improvement. Under all circumstances, therefore recommend a premium of \$5. the committee would have awarded in this case

so for premium two Straw Cutting Machines, of their invention, and which has already been By cuttings of the vine sold for invented by Charles Willis, the one with a ver- admitted with great success in several of our — Wine sold to the first of the contraction tical, the other with a horizontal wheel. The most flourishing manufactories; weaving broad wheels.

the inspection they have given of the machine award any premium in their power.
with the horizontal wheel, that it is preferable to John Bicknall, of Buckfield, presented for prethe other, and indeed to any other they have be-fore examined or seen, in point of facility of working and strength of construction, although and its character may be best understood by the it wants the power of regulating at will the length tenor of the specification of the patent, which is of feed, which is effected by Mr. Safford's mannexed, marked B, with certificates of its pracchine, to be next described. The cost of this tical application. machine is stated to be from twenty to forty dollars. The committee recommend a premium plaster thoroughly into the state of meal, yet as

ting the length of straw or hay to be cut at pleasure, by means of cogs of different diameters.

en to Willis' machine, with the horizontal wheel, it is apprehended, ultimate in a change of the was decisive with the committee, yet the circumstance stated relative to Safford's machine, they the nature of the machinery, so much less than considered as an unquestionable improvement; that used in mills of the ordinary construction.

OBSERVATIONS, &c.—This wine was made from the nature of the mills of the ordinary construction.

OBSERVATIONS, &c.—This wine was made from the produce of two acres of land; the produce of the produce of two acres of land; the produce of the mate to a very perfect instrument.

Considering the great zeal and labour Mr. Safford has exhibited in improving this instrument, and his success, the committee recommend a premium to be awarded to him of \$10.

Josiah Jaquith, of Brunswick, State of Maine, entered for premium a Corn Sheller, of a new construction,—consisting of a cylinder of cast iron, fourteen inches in height, with a perpendicular shaft passing through it and terminating in a centhe operation greatly facilitated by a horizontal balance wheel. It did its work very perfectly and the committee have no question in giving it a however, they consider useful improvements. decided preference over any other before exhibitrecommend a premium of \$10.

ficates adduced amount to such an evidence of of the Committee. use by practical farmers as their rules require. Whenever such evidence be adduced, if within six months, Mr. Jaquith will be entitled to a premium of \$20.

An improvement on the Ox Yoke was entered by John Mears, of Dorchester, County of Norfolk, with certificates of its being used and approved by practical farmers. The improvement consists in a better adaptation of the form of the duce of my Vineyard, for the year 1823. yoke to the neck of the beast, giving it a greater greater extension of the bed and tips of the voke so as to receive the bow into a bearing of six inches instead of two, as in common yokes. Al-

Messrs. Trumbull & Boynton, of Northampton, a premium, had it been an agricultural implement.

County of Hampshire, presented for examination and premium a Power Loom; an instrument principles of the alleged improvement were the cloths as fine and cheaper than any other species same, except so far as was necessary to accom- of loom. The utility of this invention is un-modate the work to the different position of the questionable. The committee however do not heels.

deem it entitled to a premium, within the scope of their authority. Were it otherwise, they should

Of the immigrants is almost entirely suspended. Of the immigrants is almost entirely suspended. turers of Providence, Feb. 1824.

24. The depression of farming has driven great numbers of our farmers to plant tobacco-and the consequent depression of tobacco planting has converted numbers of tobacco planters into cotton planters. Thus, for want of a due distribution of labour and industry, the different classes of society are crowding upon and depressing and

1,363,103 bushels of corn-26,948,115 shingles-19,451 hhds. of tobacco-48,910 barrels of tar and pitch-609,129 lbs. of indigo-and 17,725,301 feet of staves and heading more in 1790 than in 1823, although our population in the former year was only 3,929,306, and last year was about 10,500,000.

We respectfully submit, that with the advantages specified in the preceding part of this memoof things could exist, without some enormous and radical error in our policy. Were such depression inevitable here, no country could ever hope to enjoy prosperity; as no country ever had or can have the means of prosperity more completely within its grasp.

While this depression and embarrassment pervade the nation, it is impossible not to be forcibly

Both those nations carried on for about twenty 18. During six years of profound peace, with years a most desperate and sanguinary warfare, Answer to the above—which the Editor wishes great natural calamity, we have reduced our na- Britain expended 7638,000,000 dollars, of which all who pay attention to sheep, to consider as ad-tional debt only 10,000,000 dollars, although our 4653,000,000 dollars were raised by excises and

loans .- She is now encumbered with a debt of concerns are confided to your care, with full pow-3150,000,000 dollars-and raises annually the enormous sum of 230,000,000 dollars, being far beyond the state of things herein described be found to double our national debt, which her subjects pay an excise, of 8,000,000 dollars. Her excise alone, last year, was 114,000,000 dollars. One-tenth of how and by whom it may be applied. the produce of the land goes to support the clergy of the established church; and the dissenters have, in addition, to support their own clergy. Her executive costs more than four times as much as all the branches of our government, executive, legislative, and judiciary. Notwithstanding all these immense disadvantages, her wealth is most rapidly and unprecedentedly increasing. She draws silver and gold from almost all the nations of the earth. She has made large reductions of her national debt and taxes—and has lowered the interest of 697,500,000 dollars of her debt from 5 to 4 per cent.—and of 310,000,000 dollars from 4 to 3½. She has an annual surplus of above \$22,500,000, wherewith she has established an efficient sink ing fund. During the course of last year, loans were effected, or instalments paid in London to different foreign potentates and governments, no less than £50,000,000, or 225,000,000 dollars. In one word, she is making wonderful advances in national "wealth, power, and resources," while we are, in some important respects, actually retrograding-for, as we have stated above, the ex ports of wheat, Indian corn, shingles, tobacco, pitch and tar, staves and heading, and indigo, are less, some of them 20, 30, and 40 per cent. than they were in 1790! In 1796, our domestic exports were \$8 60-100 per head,—whereas in 1823, they were only \$4 50-100, notwithstanding the enormous increase in the export of cotton since 1796. In 1796, the exports of Great Britain were only \$7 75-100 per head-whereas in 1822, they were 14 dollars.

With the details of the state of France we are not so well acquainted-but we can confidently assert, without fear of contradiction, that she is her agriculture, internal trade, and manufactures are greatly increasing—and that she has effected large reductions of her national debt and taxes.
We are fully persuaded, that almost all the em-

barrassments and difficulties of our country arise from the over-proportion of our population em ployed in agriculture, whereby is produced the pernicious glut in the foreign markets, to which we have referred. But to avoid a controversy which could not answer any valuable purpose, we have forborne to enter into the discussion of bewildering theories of political economy-to defend or combat the conflicting opinions of Adam Smith and Alexander Hamilton-of John Baptiste Say and the venerable Franklin. We have sturigorous investigation. The country is arrested in the career of its high destinies, while other s rides towards wealth and prosperity. The great interests, claiming the protection of government, suffer equally. Should the pictures of distress and depression, drawn by Mr. Carter and Mr. Garnet, to pass over all the others, be but half or quarter true, the case demands the parental care of the rulers of the people. He is an unworthy shepherd, deserving to be dismissed from his trust, charged to want of skill on the subject, in my who beholds with indifference the sufferings of

his flock, when he can apply a remedy.

On a due consideration of the premises, we most respectfully request that you will appoint a committee of your honourable bodies, to institute

other taxes of various kinds, the remainder by an inquiry into the situation of the state whose ers to send for persons and papers-and, should be correct, that they will thoroughly investigate with more ease than we could pay direct taxes, or the causes, and ascertain whether any remedy can be devised; if so, what that remedy is, and

> This procedure is recommended, in the first instance, in preference to an immediate application to Congress, for two reasons. First, during all the intense suffering that this country has experienced since the close of the war, particularly in 1817, 1818, 1819, when the distress was almost universal, no class or description of citizens having wholly escaped, Congress has instituted no inquiry on the subject-and secondly, because it would be wholly impracticable to collect in one spot, even by congressional authority, all the necessary information respecting the state of a coun-pondent, T. H. Mitchell, Esquire, and consists of try so widely extended.

Philadelphia, October 16th, 1824.

Horticulture and Botany.

Receipt and distribution of SEED, GRAIN, &c

[For want of leisure we have omitted our regular notice of Seed, Grain, &c. &c. received for distribution and trial. We will endeavour hereafter in any degree conducive to science, economy, or to be more regular and systematic in this particu- ornament. Yours, &c. lar. By-the-by, we have every week occasion to regret the want of some well conducted botanical and horticultural establishment near the city, where the offerings which are made to us, might be disposed of and cultivated in a manner most advantageous to the publick.

From Midshipman Theodorick Bland, who lately returned from a three years' cruise in the Pa-cific, under Commodore STUART, we have received a variety of Seeds, with some curious contributions to our Academy of Sciences, for which the gardens of nature. we are much indebted; and the more gratified as assert, without fear of contradiction, that she is also making rapid advances in prosperity—that the happy influence of the good example of our root is so highly medicinal, as to be used in the happy influence of the good example of our same cases where the Asiatic Columba is employgiven, in a most laudable manner, every possible ed. There is no doubt in my mind that it will attention to the interests of American horticul- succeed in the vicinity of this city, and be a great ture and agriculture. With the following note ornament to our gardens; for a few weeks ago I from General Calvin Jones, we received half procured specimens from a farm in Venango counan ounce of the "Jackson Pea." They are of ty, Pennsylvania, along the state road, between singular, curious, and beautiful shape and colour Franklin and Warren, some miles to the east-mot so round, so hard, or so large as those which ward of Oil Creek. That spot is farther north the General sowed on the field of New-Orleans, than New-York, and from its elevation is consideand which yielded such a bountiful crop of national joy and glory.]—Ed. Am. Farmer.

Be obliging enough to offer these productions of

Wake Forest, Oct. 24, 1824.

I send you another small parcel of the Jackson tion. Pea. I raised three stalks only-they were large, diously confined ourselves to substantial facts, and appearances indicated that they would be exwhich we request may be submitted to the most
viewrous investigation. The country is a reacted pose of its renovation.

If you failed to receive from Mr. M'Leod the countries, less highly favoured, are making rapid Whitfield, or Black Pea, mentioned by him in a the farm of Dr. Thomas Johnson, of Baltimore communication to the American Farmer, I will county, has been left with the Editor of the Faragricultural interest, embracing 83 per cent. of in the course of the winter, send you a barrel.—mer—and, as it is of extraordinary growth, the our population, suffers most grievously. A vote of thanks was unanimously voted to Dr.

A LARGE POTATO, weighing 21 lbs. from

Baltimore, Nov. 13th, 1824.

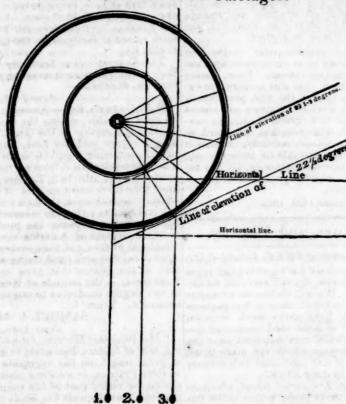

Dear Sir,-The plant sent for my inspection, is the Elumus Virginicus-3dria, 250nta-(Lime grass -wild rye.)

I deeply regret the present impossibility of continuing the Botanical Sketch-but entertain hopes of soon being able to resume that interesting and consolatory task.

With great respect and esteem, yours, L. H. GIRARDIN,

Novel Inventions.

An Improvement in Carriages.

TO THE EDITOR OF THE AMERICAN FARMER.

Auburn, Fauq. Co. Va. July 17, 1824. Sir,—Being under the impression that an improvement in Carriages, will be regarded with some degree of interest by many of your patrons, I am influenced to take the liberty of giving you my views on a subject in relation to them; and should I be so fortunate as to detect an erroneous impression, which perhaps may exist, I shall esteem myself amply compensated in the reflection, that I have been an instrument in contributing a spark to that flame of science in our country, which still continues to brighten from its repeated accessions.

The above plan shows the best method of making wheels for agricultural purposes. The large circle represents a wheel of six feet diameter, the small one of three feet. The plumb line, fig. 1, represents the centre of the axle. Fig. 2, the line of pressure of the small wheel. Fig 3, represents the line of pressure of the large wheel when ascending an elevation of 221 degrees. It is a point well understood, that all large wheels when drawn horizontally, will carry a greater burden with less power than a smaller; when as-cending an elevation, you will find them the re-verse. The line of pressure of the large wheel when ascending an elevation of 221 degrees, is double as far in front of the axle, and of course the inclination to descend is double as great, besides the weight of the large wheel which hangs back from the plumb line, fig. 3.

It is also known, that a good horse can labour all day with a draught of 200 lbs., and four horses this weight is put on large wheels, it will descend and strength will be added to the wheel. wi h double the force of one of half the size .-

hinder wheel should be the same size as the one before. Many advantages would arise from this regulation. They will not cost so much in the first instance. 2dly. There will be much less danger in upsetting. 3dly. More convenient in loading-and lastly, much stronger. The calculation should be made from the horses shoulders, and so contrived that the chains may draw in a right angle from the shoulders of the animal; and to effect this plan, the double and single trees stay-chain fastened at the bottom of the axle— the power and the weight would then be in a direct line.

and a quarter. The manner in which this axle is from the age of eight years upward: but as his ironed, gives as much strength as one of five inmeans will not now enable him to incur the exches ironed in the usual way. The following is pense of their maintenance, he has concluded to the method:—No shoulder should be left to this appeal to the liberality of the publick. axle; the slope should be continued from the little end at least five inches further than the shoul der, or from the nut or hub; the top and bottom on the top part, and of good substance: a screw

in hopes, that the following explanation will ge nerally be understood: The face of this mould board was made by a machine, which shews all the properties to raise and turn the sod from its natural bed with the least possible resistance.-This plough is generally used without a sword or a lock coulter, but answers well with either-the front of the mould board is keen and made so hard that the earth makes but little impression on it-the land side as far as it sinks in the earth is perpendicular, and immediately above this a moderate inclination is made towards the nearest part of the earth; then again a considerable curve is opposite to this and towards the land side, the object of which is to place the beam from over the body of the plough, so far on the land side as to permit all vegetable matter to pass off; and to fasten the hinder end of the beam to the outside of the handle. As a further inducement to practical and observing agriculturists, the mould board adjusts itself to their convenience by turning a contractor and expander. I am in the habit of using double and single trees, differing, in many respects, from the old method. The double tree is longer than usual: near each end there are several holes, the object of which is to screw the single trees on the top of the double tree ;-by this means provision is made for the difference in the strength of horses, and for expanding and contracting the single trees to suit the convenience of the farmer, or to give or take land from the plough; and they also prevent the tangling of geer, and save at least 50 per cent. expense.

Should your Agricultural Society permit me to become a candidate at your next exhibition for the best plough, I will endeavour to prove, that Virginia has not yet been lulled by the seducing charms of indolence; nor is she deterred from entering the lists, although in opposition to the perseverance and ingenuity of the Northern States.

Very respectfully, &c. STEPHEN M'CORMICK.

Domestic Economy.

FOR THE AMERICAN FARMER. A BENEVOLENT PROJECT,

Worthy of publick support.

HENRY BERNHARD, a native of Germany, who should be fixed under the wagon tongue, and the has been a worthy resident in this country, as a manufacturer, about thirty years, has now established in Baltimore a Manufactory of Silk Buttone, which has been for some time in successful I will now proceed to make a few remarks respecting the axle: I would advise that the largest the number of hands that he has employed, by part be four inches in diameter, and the end two the addition of twenty children of both sexes,

It is his intention, should he succeed in this appeal, not only to teach the children his trade, and maintain and clothe them decently, but also to skeen should be as long as the taper of the axle have them instructed in reading and writing.-They will be required to attend the churches of bolt should pass through the axle and the large such religious denominations, as may be pointed end of the skeens—the shoulder for the large box out by their parents, or if they are orphans, by to press against, is a band of iron 1 of an inch those who place them under his care. The adthick and upwards of two inches wide, which vantages which will attend this plan are numeshould be well put on to secure the two skeens rous; the children taken from the different States and to give a permanent shoulder for the box to will be themselves able, on their return to their press against, and which secures the axle from respective homes, to superintend similar manu-being broken; and as the axle will diminish in factures; and at the same time that they are to a good wagon will carry about 4000 lbs. When size, so in that ratio will the friction be lessened complete masters of their trade, they will, in consequence of the manner in which he professes to In addition to the above, I take this opportunity bring them up, have escaped the depravity and However, our first consideration is, to enquire to remark, that I have made an excellent imignorance usually tolerated in manufacturing eswhat is the best sized wheel for a wagon? My provement in my plough, which has been so succept the depravity and ignorance usually tolerated in manufacturing establishments, and be also mora), intelligent, and opinion is from 3½ to 4 feet in diameter. The cessfully used in this section of the country. I am useful citizens. the children will be so far advanced in their ap- work-and that the average number of miles exprenticeship, that their labour will be at least an ecuted annually in that State does not exceed 50 vicinity for a considerable time. equivalent for their maintenance and education. —being one-third less than that which has been The girls will be required to serve until they are done of the Chesapeake and Delaware Canal. sixteen, and the boys until they are twenty-one years of age. He has now four children employ ed in his manufactory, and he is ready to show specimens of the rapid progress which they have made in learning the trade.

Henry Bernhard engages, that the buttons manufactured in his establishment, shall not only be tions they have made for its accomplishment. much cheaper, but better made than any that are now imported. It is his intention to take them to the Agricultural Exhibition, where they will exhibit their skill in the presence of the "Nation's Guest," with specimens of their manufacture.

Those who are disposed to encourage his undertaking, will subscribe any sum towards it which amount of their subscriptions in the product of the children.

local, and that orphans, and the children of the poor and destitute, from any part of the Union, who may be enabled, with the assistance of the charitable, to reach his establishment, will be received and treated by him with equal care and

JOCKEY CLUB RACES AT TREE-HILL.

account of the races :-

First Day-Two mile heats.

Second Day-Three mile heats.
Proprietor's Purse, for \$300-two entered-

piration of twenty years, possess a larger rent- obtain, we believe much more cotton was planted tilla; and Mr. Johnson's Jeanette, (now Virginia roll than any subject in the world. Yet it was this season than last; allowing, therefore, for the La Fayette.) The first heat was won without

Fourth Day.

A Match Race for \$500-mile heats-between a horse of Mr. Carter's, and a filly of Mr. Hare. Won with ease by the latter.

A Match Race for \$500—two mile heats—be-tween a horse of Mr. Archy M. Harrison's, by Sir Alfred, and a horse of Mr. Sampson's, by Shylock. Won with ease by the latter.

Fifth Day.

Handy-Cap Purse for \$200-two mile heats-Betsey Richards; Mr. Selden's filly, and Aratus started-10 pounds taken from Aratus; the filly carrying a fly. Won with ease at two heats by Aratus.

On no previous day of the Races, did there appear a greater display of interest than on the last. Betsey Richards, owned by Mr. Johnson, was almost the universal favorite previous to the first heat being run. This was sufficiently evidenced by the difficulty of obtaining bets. Three to one on Betsey Richards was early offered and taken up. In one instance, I understand a bet of seven hundred dollars to two was made. Indeed, it became difficult to obtain bets on any terms.

Never, however, did people appear more disappointed than at the result of the first heat .-Aratus came out several lengths ahead, apparently under a bearing rein. The knowing ones be-gun to hang their heads: and many of the most sanguine friends of Betsey Richards declined bets at the odds of two to one against her. A number, however, were taken at three to one-and lost!

It was remarked by the friends of Betsey Richards that she was out of trim, and apprehensions for her success were early expressed on that ground. The second heat clearly demonstrated that they were not far out in their calculations; Aratus beat her with the utmost ease. Mr. Selden's beautiful filly, made a very fine run. It was thought by many that she would beat Betsey Richards the second heat. But in this they were disappointed. Betsey Richards proved second best.

A trotting match recently took place in England, two horses to trot sixty miles for a bet of 200 sovereigns. The winning horse performed the distance in five hours, forty eight minutes and twenty-two seconds. The other horse was five hours, fifty-three minutes and twenty seconds, in

RECIPES.

Bite of a Spider .- A Correspondent informs us that he was lately bitten on the neck, by a common sized spider, while lying in his bed. The bite not being very severe, he did not apprehend any danger from it; but directly the bitten part began to inflame, and soon his whole system was affected by pains. He then became sensible that a remedy must immediately be applied; and the A friend has politely handed us the following course he pursued, and which he recommends others to adopt, as effectual, in similar cases, is as follows :- first, apply a drawing poultice to the poisoned part; after the poultice has been on a short time, take it off and bind in its place part as the patient can bear, for the space of twelve hours. If the stomach of the patient is much inflamed, give a dose of salts .- West Carolinian.

Locked Jaw .- Several years ago, during a conwas expected, will enhance the price to movers and settlers. From the best information we can Hillery's horse Marion; Mr. Wynn's mare Flirthe Locked Jaw, an intelligent master of a vesexcruciating torture—the attending physician crop, he plants about the 12th of July could afford him no relief. Providentially a lady,

A CORRESPONDATION OF THE PROPERTY OF T who heard the above conversation, recommended the warm lye bath, into which his foot was placed-within 15 minutes the anguish was taken out: he went to bed and slept quietly. The application of lye was made for 10 succeeding days; no pain, no uneasy sensation returned, but what is incident to a common sore, and on the 11th day, Capt. Gordon walked abroad .- N. Mercury.

-0-FROM THE PROVIDENCE PATRIOT.

Large and round Turnip .- Mr. Wm. Whitaker, of Attleborough, Mass. has this year raised and exhibited at this office, a round Turnip weighing eighteen pounds and measuring forty-two inches in circumference; and what is worthy of notice, it was only eighty days from the time the seed was put into the earth, before the turnip was gathered. "Beat this if you can."

JOHN WELLS, Chairman. Brighton, Oct. 21, 1824.

REPORT No. IV.

The Committee on Manufactures award-For Broadcloth-the first premium to Slater and Howard, of Dudley, he second do. to the Bellingham Cotton and Woollen Manufactory,

Two specimens of Black Cloth from the Saxon Factory at Framingham, were offered for exhibition only. It was considered a very beautiful specimen of Cloth.

For Household Cloth-the first premium to George M. Barrett, of Concord, The second to Oliver Moore, of West Boylston, 8

There were five entries of Household Cloth. some of which would not discredit a professed manufacturer.

For Cassimeres—the first premium to Slater and Howard,

The specimens offered by them were of very uncommon excellence.

For double milled Kersey-the 2d premium to Tristram Little, of Newbury,

The second to Trueman Clark & Co. of Wal-

The Satinet presented by John Sampson, of Plympton, would have been entitled to the second premium, had it been entered in season.

For Flannels of Household Manufacture-the first premium to Theodore Lyman, of Northampton, for a very beautiful specimen, The second to Elizabeth Jay, of New Braintree, 7

The coloured Flannels offered by the Ware Manufacturing Company for exhibition only, were thought very creditable to the company, and the colours uncommonly good. They were woven in

There were two pieces of White Flannel from the Amesbury Flannel Manufacturing Company, one of them woven by water power, which is supposed to save half the expense of weaving by hand. The use of water power for the manufacture of flannel is said, on respectable authority, not to have been yet commenced in Great Britain, and is an American invention. The Amesbury Flannels rival the best imported flannels.

For Carpeting-the first premium to Mrs. Gideon Delano, of New Braintree, The second to Mrs. Levi Goodale, of West Boylston.

For Blankets-the second premium to Mrs. Cyrus Hubbard, of Concord,

Mr. John Hunter exhibited the best specimen The other half do. to Abiel Wheeler, of Concord. of Blanketing, of very superior quality. The ar-Some Pigs sent by Mr. Manners, the British ticle not being made up into blankets, as required Consul, for exhibition only, were very much ad by the rule, the committee were unable to give him a premium.

Hunter, of New Braintree, for the best wide Diaper,

The second premium for wide Diaper to Mrs. Leah Coburn, of Dracut, The second to John Tower, of Cummington, For Sewing Silk-the second premium to Emily Fitch, of Hopkinton,

There was no specimen entitled to the first remium.

The tables were covered, as in past years, with a variety of substantial fabrics and fancy articles, not objects of specific premium. The committee recommend that the following sums be given as gratuities :-

To Mary Stearns, of Waltham, for a Coverlet, \$3

To Mary B. Withington, of Dorchester, for a Counterpare,

To Jane D' Grant, of Wrentham, for an imitation Leghorn Bonnet,

To Maria Hartwell, of Shirley, for do.

To Hannah Carpenter, of Norton, for a Dunstable Straw Bonnet,

To Elizabeth Hapgood, of Marlborough, for a Straw Hat,

To Lucy Ann Howe, of Hopkinton, for Needle Work,

To the Misses Wheelers, of Worcester, for a specimen of Artificial Flowers,

To Percy Cobb, of New Braintree, for an imitation of English Cassimere Shawls-a new manufacture in this country, To a young lady at Brighton, for a specimen of

Silk Buttons and Frogs, equal to any ever imported.

To Naomi Abbot, of Boston, for a Lace Veil, To Charlotte Brown, of Wrentham, for artificial Flowers,

To Emily Francis, Harriet Josephine and Wm. Jones, and Frederick Augustus Fisk, for spe-cimens of Artificial Flowers, \$1 each,

To Miss Hannah M. Johnson, for a specimen of Silk Buttons and Frogs, and a Lace Veil, &c. 2 To Elizabeth P. Parsons, of North Yarmouth, for a Leghorn Bonnet,

To Mr. Battel, of Dover, for a specimen of Whip Lashes of a very superior quality,

To Prudence Howe Carter, of Leominster, for fine knit Socks,

To Triphena Smith, of Lincoln, for fine knit Stockings,

To Lucy Sprague, of Bridgewater, for Worsted knit Stockings,

To Miss H. Green, of Lincoln, for a specimen of Cricket Coverings, To Hannah Flint, of Lincoln, for Worsted

Stockings,

To M. B. and C. L. Scott, of Boston, pupils at the Academy of Misses M. A. & S. Clark, for a beautiful Hearth Rug,

To Mary Manning, of Charlestown, for a hearth Rug,

To Abigail Pomeroy, of Watertown, for a hearth

Rug, To Sarah Robinson, of Newton, for a patch work Carpet,

To Patty Spaulding, of Natick, for a Hearth Rug,

To Ann Dalrymple, of Marlboro', for Dunstable Straw and Imitation Leghorn Bonnets,

satisfactory reward.

exhibited by Andrew J. Allen, and manufactured Hastings, of Sterling, in the County of Worcesat Leominster, were of excellent quality

Curtis, of Pepperell, were also excellent.

The samples of Men's Hats exhibited by J. M. Peck, of Boston, were in every respect of the be used for this article; the glazing imparts a de-

offered for this article, having been exhibited.

Two Hives well stored with Honey, were entered for the society's premium, by Mr. Ebenezer Withington, of Dorchester, to whom your committee recommend to be paid ten dollars. His method of excluding the bee moth from the hive, will doubtless be published in the Society's Jour-A Glass Hive, containing about fifty pounds to whom was also committed the inspection of of Honey, of the very first quality, was exhibited by Brig. Gen. Dearborn, of Roxbury, accompa nied with the following communication: "The Glass Hive was placed over a wooden one, having a hole in the top, into which a swarm had been put in June, 1823. Last June the young swarm gave indications of leaving the wooden hive, but in a few days commenced filling the glass one, which they accomplished in 22 days, and then swarmed. They were put into a wooden hive, and a glass one placed over it for the young swarm to fill the next season. Only three bees were found remaining in the glass hive the next morning after the bees swarmed.'

Some large roots of the Mangel Wurtzel, white tributed to the food of the cows. Of the old Sugar Beet, and Russian Radish, were exhibited by John Prince, Esq. of Roxbury, who also sent to the Society's Hall a few ears of corn, from seed received from Mr. Skinner, of Baltimore, called Waugh Paugn Cornetta, of dark mixed colours;

Mr. William Ackers, also exhibited some large ears of Yellow Corn-and the Hon. Richard Sulmium, some of it of a very good quality; but livan sent from his farm in Brookline, some very much of it deficient in a most essential point in large roots of Mangel Wurtzel. Some Mustard, making good butter, that of sufficiently working in canisters and bottles, and manufactured by Mr. Bickford, of Boston, was entered for exhibition, tion for the excellence of the articles of manufac-ly, and fully as possible expressed from it—that and found on trial to be of a very excellent qualiture exhibited by them. Some of them probably from the dairy of Mr. Michael Crosby, of Bed-ty. Four parcels of Calf Skins, and three parcels Four parcels of Calf Skins, and three parcels do not expect a gratuity in money, and as respects ford, in the County of Middlesex, was considered of Sole Leather, were exhibited at the Society's all not otherwise noticed, the committee hope to be the best, and is entitled to the premium Hall; the former appeared to be extremely well that an acknowledgment of their merit will be a of fifteen dollars—that from the dairy of Luke dressed. No premiums were offered the present year for the article of leather.

THOS. L. WINTHROP, Chairman. ISRAEL THORNDIKE, BENJAMIN GUILD.

Brighton, Oct. 21, 1824.

The further claims for premiums on Agriculbest quality.

A specimen of Carpeting presented by Mary
Robinson, of Worcester, Elijah Wood, of Conspective and Cheese, both of which fording time for the competitors to exhibit the cord, and Mrs. —— Flags, were good fabrics, are of good quality—the Cheese, in the opinion evidence required. Soon thereafter the commit-

There is also another chines; therefore, it must be evident, the only this measure, that its vast importance to the nation, into account the numerous daily vehicles of every may be adapted for the peculiar construction of as well as to individuals, can be properly known description for the conveyance of persons, and of steam-machinery, by a perfectly even and solid and understood,) and the many millions now an merchandise of every kind, all which might condiminish the expense of conveyance. To give the necessary encouragement to the rapid improvements of mechanical power, the common turn-pike roads should be left as they now are, with-other shot. out any further waste of public money in delusive schemes, and a perfectly new system of convey ance begun, more consonant with the spirit of the times, and better adapted for the immense intercourse and increasing traffic of this great commercial nation.

I remain, Sir, Yours respectfully, THOMAS GRAY.

Atotingham, 2d August, 1824.

Rural Sports.

[Another Partridge Match was shot last week at Hampton, only 56 birds were bagged; birds were scarce, and the match closed at an early hour .-The losers paid a good oyster supper; and as we were invited to partake of it, we shall say no more about the matter, but wish them more birds and better luck. The following extracts from the 725 partridges, 701 pheasants, 49 snipes, 6 wood "Annals of Sporting," show the number of game cocks, and 3492 rabbits, making in the whole 5548 killed at celebrated shooting matches in Europe.] -ED. AM. FAR.

EXTRAORDINARY SHOOTING EXPLOITS .- To the Editor of the Annals of Sporting.

Sir,-As much interest has been lately excited in the Sporting World by the recent performances of Lord Kennedy and Mr. Coke, I beg leave to send you the following list of the most remarkable occurrences in this way that have taken place by seven gentlemen. for some time past.

which he killed five pheasants. This is the greatest individual performance on record. Lord Kennedy, in two days, bagged 132 brace; thus losing the wager by 41 brace. The exploit of Lord Kennedy in August, 1822, will be fresh in the recollections of the readers of these Annals.

In 1809, Messrs. Austin and Foster shot upon the manor of Fobsey-Magnus, in Cornwall, and killed, in the course of the day, 43 brace of birds.

In addition to his partridges, Mr. Austin killed of game during the last week in the season of 1807. killed, in the course of the day, 43 brace of birds. In addition to his partridges, Mr. Austin killed five hares and a water-rail. Both gentlemen used spectacles.

On the 3d of September, Mr. Lacey, of Wimborne-Minster, shot upon the manor of Verwood, Dorsetshire, which contains only 2500 acres, thirty brace of partridges, ten brace of hares, and 42 couple of rabbits. He commenced his day's sport with the rising sun, and closed it at four o'clock. He was attended by six servants and four couple

Lord Kingston made a considerable bet to shoot forty brace of partridges, on the 1st of September, on the manor of Heydon. He shot forty-one days' shooting has never missed. brace and a half.

In 1811, Mr. S. Clark, of Worlington, Suffolk, engaged, for a bet of fifty pounds, to kill and bag forty-seven shots out of fifty. He killed the first forty-eight, missed the forty-ninth, killed the fif-tieth, and continued shooting until he killed the ten following, making sixty shots with the loss of lively few. only one bird. As far as the art of shooting is concerned, this will be found superior to the exploit of Mr. W. Coke, as the latter missed a great number of shots: on the second day, for instance, he discharged 327 shots, bagged 180 birds, (pheasants included,) and, consequently, missed 147 shots. Some idea may be formed of the quantity of game on the ground chosen by Mr. W. Coke, ed (commencing with stags, roebucks, boars, fox from the circumstance that in one field of Swe-es, &c.) The emperor himself had the greatest dish turnips, of twenty acres, he bagged thirty number of shots, viz: 9794, of which 978 took Country.

with a less propelling power, and consequently brace. It may be also further remarked that he place in one day. S. A. R. la Princesse Charlotte missed more shots on the first day than on the second; so that, on a moderate calculation, it may be fairly presumed that he missed almost every

> A gentleman of Sussex, on the 2d of September, 1811, went on a shooting excursion into Norfolk, and, after pursuing his diversion for eleven successive days, made the following return:-

one forenoon, 36 hares, 35 cock pheasants, 18 rab- Casarte (640 of which were partridges) in a very bits, and one woodceck

On the 28th of January, 1812, John Mosely been bagged on the same manor.

In the same year (1812) there were killed, upon the manor of Riddlesworth, in Nortolk, 574 hares,

In 1811, when Lord Moira (Marq of Hastings) and several other shots of distinction were on a visit to Mr Coke, in Nortolk, the following were bagged in six days: 264 pheasants, 314 partridges, 29 woodcocks, 46 snipes, 283 hares, 371 rabbits; total, 1307.

In December, 1808, at Gipping, near Stowmarket, the seat of Sir John Snelly, 91 hares, 64 a single stalk, in Pennsylvania, I am induced to pheasants, and 101 rabbits were killed in one day publish the wonderful fruitfulness of Rye, which

The Duke of Rutland, at Chevely Park, attend-The return of Mr. W. Coke's shooting for two ed by his gamekeeper, killed 109 head of game. 55 grains each, making in all 3905 grains. This days was 173 brace of partridges, in addition to On the following day, all the sporting gentlemen very extraordinary stalk is preserved and can be and parkkeepers went out, and killed as much produced any moment. game as filled four one horse carts? The whole was dressed on the day of the Grand Jubilee.
In October, 1807, at Up-Park, Sussex, the seat

of Sir W. Featherstonhaugh, 501 brace of game were shot, from Wednesday morning, the 7th, to Saturday night, the 10th, by a party who came on

had a shooting party at Holkham, who killed, in three days, 1457 head of game.

In 1808, Mr. Coke and seven other gentlemen killed, in fifteen successive days, (Sundays excepted,) 1131 hares, 214 pheasants, 350 partridges, 883 rabbits, 30 woodcocks, 12 woodpigeons, three nipes; total 2863.

A Mr. Jenkins, near Petworth, in Sussex, has been known to kill 20 brace of partridges in a took them fairly as they happened; and in four

The last day which the unfortunate Louis XVI enjoyed in the field, he himself shot 572 head of game; but no mention is made of the number of shots which he missed. If, however, as a marks-

man, he was equal to his brother, Louis XVIII. the number of shots missed would be compara-

Rec

THE FIRST DAY of this grand annual Farmer's Festival passed most happily The weather was uncommonly fine, and the display of all sorts of domestic animals-specimens of crops, butter, domestic wines and household fabrics, &c. &c. altogether far exceeded any thing hitherto witnessed. The conviction of the great utility of these public agricultural displays, seems now to day at forty shots, without selecting the shots, but have taken fast hold of the public mind, and to pervade so extensively every part of the state, that gentlemen were attracted to this one from the most distant points. Not less than fifty Horses of superior quality and of different ages and classes passed under inspection. Nearly one hundred neat Cattle; a great number of Sheep, and the pens for Swine were so filled that it became necessary to erect many more after the exhibition commenced. Unexampled improvement was observed to have taken place in this class of animals. The great satisfaction expressed by all, enables 1753, beginning the 29th of August and continued us to congratulate the state on the permanent establishment of these shows, and the number of tered game; it contains columns, specifying the sales of stock of improved blood, evinces, that to them the Farmers will look hereafter as to a women, with the number and kinds of game kill-common market, where domestic animals of the ed (commencing with stags, roebucks, boars, fox highest grade of excellence will be sold and bought, and their blood diffused throughout the

By J. S. SKINNER - General S. Van Ransellear; his heart leads and his means freely follow, in the ways of publick usefulness.

The following was offered as the parting toast by Dr. GRAFTON DUVAL, of Frederick-Speed the Plough.

The company then separated with a general sentiment of gratification and good wishes for the success of the society.

Early in the evening the General visited the Theatre to witness the performance of the favou-rite play of General Washington, the School for Scandal, and never was play better performed. All exerted themselves to please and all succeeded. Mr. Warren, in Sir Peter Teazle, was great in the great point in which great playing consists:
he was exactly true to nature. When the point of the play was developed in the screen scene, the General with his suite, retired to meet a a large party of Ladies and of Agricultural Gentlemen who had been brought together for the occasion, at the house of the Editor of the American Farmer, and afterwards visited at the residence of R. B. MAGRUDER, Esq. the daughter friend, G. W. La Fayette, expressive of his thanks and family of his old companion in revolutionary scenes-General STRICKER, the soldier of two wars, and the patriot of all times.

> Thus psssed the day ever memorable hereafter in the annals of Agriculture, as having been dedicated by American Farmers to the entertainment of the Farmer of La Grange.

It was not until an hour since, that we could take pen in hand to give even this hasty record of By H. Schroeder-Liberty, genuine rational its incidents, and as it was necessary to transcribe tiberty: May the universe become its temple, and all the volunteer toasts, allowance is solicited for the heart of every man its altar.

> The reports of the committees, with their awards, and the names of the fortunate competitors will be given in our next-if possible.

The Editor was last week absent when the Farmer went to press, and has been this week so much occupied in arrangements for the Cattle Show of the Maryland Agricultural Society, for the Western Shore, that it has been impossible. for him to attend, strictly, to his more immediate editorial duties. Of the Show at Easton, he has not had time, and he fears will not, to give, even a sketch. He much regretted that the hospitality, and kind attention, which characterise that refin-By W. F. A Farm on Elk-Ridge,

FOR SALE.

My presence being required on my estate at West River, I will sell the Farm whereon I reside, five miles from Ellicott's Mills, four miles from Owens', one mile from Oakland, and about nine miles from Worthington's, near Elk Ridge Landing, where the Baltimore price is always given, I believe, for grain; -by the way of Ellicott's it is THE EASTERN SHORE CATTLE SHOW. fifteen miles from Baltimore, fourteen miles by Elk-Ridge Landing, and about twelve miles by a way that is to be opened in the spring to Fridge & Morris' Fictory, and twenty six miles from Washington City: the roads being turnpiked renders it very convenient for marketing. It adjoins Doctors Thomas, and Stockett; and Geo. Cook, Larken Dorsey, Samuel Brown, and John W. Dorsey, Esqs. and in sight of twelve or fifteen others, the most respectable inhabitants-In fact, for health, beauty, and society, no situation can be more desirable. The farm contains about four hundred acres, is now in good order, and with the use only of clover and plaster, capable of being made one of the best in Maryland. It can be divided into eight fields, each to have water running through it. The Dwelling is newly finished, (brick and ruffcast, 52 feet by 42, with four rooms below and five above, and good cellars under the whole) A further description is considered unevery way suitable to the times, and will make While no great improvement was discernible in the payments in every respect convenient to the

Dr. Smith expressed his wishes that the benefits of these improvements should be extended through General La Fayette, to the citizens of his native country; to further which benevolent design, the General expressed his entire willingness; returning his most cordial thanks for the appearance and deep ravines, returning his most cordial thanks for the advances made—the subject of Vaccination of Vaccination advances made—the subject of Vaccination of Sample of S being one in which every friend to humanity was deeply interested.

A most curious, and pleasing exhibition, and particularly worthy of notice in our Domestic Manufactures, was not, we regret, adverted to in our last. It was the four little girls under the care of Mr. Bernahrd, who has lately established a Silk Button Manufactory in this City, on the philanthropic plan described in our 35th number. These girls, the youngest of whom is only eight years of age, worked, sang, and amused themselves, not as if they were performing a labour, but as if it was a part of a Fete. The concourse assembled on the ground were delighted with instructions, to be apart from selfish consideragirls with a set of buttons, a watch chain and a proper here to remark, that he had to haul nearly highly useful at once to the tassel for his cane, which he received with the all the rails on his farm, to the amount of 60,000, ral and financial interests.

Your committee were pr suring them he would wear their present, and that they would never be forgotten by him.]

REPORT OF COMMITTEE ON BEST CULTIVATED FARMS.

on the 13th instant; owing to the distance at this he has been careful in converting every thing which the judges reside from each other and other circumstances, two only of the judges attended: whereupon, they appointed J. M. Wise, and proceeded forthwith to make an actual and minute inspection of the existing condition of, and growing crops on the premises; and to ascertain by the best evidence within their reach, the situation and capacity of the farm in question when it came advantages of an improvement at small cost; and

into the possession of its present occupant.

For the evidence on which they ground their report, independently of their own observations and opinions, your committee refer to the documents and vouchers herewith exhibited.

Your committee have ascertained from Col. Bosley, and the corroborating statements of some have favoured us with valuable original commu- of his neighbours, that he has had the farm in of which combined, indicated to the purchaser Immediately after the delivery of the premi. the great labour and difficulties he would have to ments, judicious arrangements, and a neatness of throughout the State, and are the more remarka-culture so pleasing to the eye. Its every part in-ble on a farm recommended to the attention of dicates the closest attention to that character of the Society, by so many other proofs of indeneat and economical husbandry, so highly desira-fatigable industry and sound judgment. His ble in all agricultural establishments.

> and grain, clean and flourishing, which so completely cover them. Your committee were highly gratified with that admirable system in the management of this farm, the soul of every improvement, under which time is taken "by the appearance and excellent condition of a young or the soul of the so eight miles.

Col Bosley's views of agricultural improvement, farm in the year 1816, amounting to \$6,502 27fixing as its basis the principle of a liberal return \$2,378 4 of which was the amount of hay sold; and to the soil, which reason and experience, as well though your committee well remember, the very as late writers, have so highly approved. Instead favorable prices which contributed to nake this CULTIVATED FARMS.

of taking every thing from, it has been his object large receipt, yet an inspection of the quantity to offer it every inducement for its gratitude, by sold, indicated how greatly the soil had been improved award the premiums offered for the best culti-ed, that the usual practice of exhausting the soil, ment made in that short time, on a farm so misevated farm, report:

That, according to a request made by Col. Nichalds, in Baltimore county, they made a visit of inspection to his farm which should ensure a future fertility—to effect ago, and many of our valuable citizens were seiling Vol. 6.—37.

to manure, and instead of permitting his cattle to graze his meadows, he has allowed the vegetable matter to undergo a decomposition, favourable to its future fertility.

It is by these means, that the clover and plaster system will be an invaluable treasure to Maryland, affording to those of slender means, the it is the consolation of every well wisher of the interests of this State, to know that the greatest portion of its lands is highly susceptible of improvement by this course. Indeed, while Col, Bosley pursued the clover and plaster system, his expense of bringing the soil to a state of productiveness, was such only as to prove to your committee that it will be in the reach of almost eve-Col. Bosley, therefore, has never kept a great stock of domestic animals.

Your committee deem it their duty to notice, according to their judgment, a defect in the management of Hay-fields, by a comparative neglect of the means at once so simple, and so indispenviews now are to increase the number of his do-Your committee were also forcibly struck with mestic animals, and yet more to improve their the appearance of the high and steep accivites of quality; and for this purpose he intends to make flourishing appearance, and the crops of grass your committee hope, Col. Bosley will be enabled

forelock," and provision is made for all work, and chard, the disposition on the part of the propriesuitable work provided for all seasons; a system tor of this estate, to cultivate that valuable and which turns to advantage the very obstacles which indispensable appendage to a well cultivated originally threw such difficulties in the way of im-farm. There is no class of men who can, with so provement; the ravines which have been closed; much reason, be considered independent as the the fences which are built on such permanent American farmers; and it should be their duty, foundations, and the fine roads through his farm; therefore, as it certainly will be their pleasure, to all which the stone which had hitherto obstruct- to bring within their reach, not only the substanthem-and the Nation's Guest was greatly pleased at a view, which spoke the manner of Mr. B's. Smith's colt, by the same norse, calculated for the general use of the country, for carriage and gig; and Mr. Richardson's colt Young Corn Planter, powerful and active, calculated for slow draft. Dr. Grafton Duvall exhibited a very fine blood colt; and several other gen-

tlemen, horses that did them great credit.

CHAS. STERETT RIDGELY,

JAMES HOOD, of Jno. JACOB G. DAVIES.

Note on the Report on Horses.

We may take this case, as applicable to all the rest, to make some remarks on the appointment of judges. The difficulty consists, not in finding gentlemen who have all the talents and all the judgment necessary to inspire full confidence in their awards-it consists in getting such men to assemble punctually on the ground where the work is to be done.—Hence the practice of appointing, in each case, a much greater number than are necessary, in order to make sure of at least three to execute the business. It has occur-red to the Trustees, that this difficulty might be obviated by the appointment of persons in and near the city, every way qualified for the task; but they have been aware how apt such a course would be to subject their proceedings to the charge and the appearance of local partiality and influence; and hence they have chosen rather to run the risk of not getting a sufficient number to attend, than not to diffuse those appointments throughout the State—for they wish it to be regarded, as it is in fact, an association for the benefit of the agriculture of the whole state. To illustrate our meaning in this case, the Trustees adapted to our climate and usage; and the exselected, as judges of horses, and gave notice to them some months back, in writing, Nathan Luff-borough, Esq. of the District of Columbia, Col. J. Tayloe, ditto. C. S. Ridgely, James Hood, Frisby Tilghman, and J. G. Davies—all of them known in the State, to have owned, to have an eye for, and to be fond of good horses; of these, three only attended, and in some instances, out of eight or ten appointed, not more than one attended .- This explanation is made to vindicate both the rule of appointment, and the number appointed.

following report, viz.—
1. Samuel H. Ridgley for his sorrel mare Virginia, is entitled to the premium offered for the best brood mare for the saddle.

2. To Henry Thompson they award the pre-mium offered for the second best brood mare for

the saddle, for his sorrel mare Mary

3. To Gen. R. G. Harper, for his bay mare Blossom, by Top Gallant, and now in foal, the premium offered for the best brood mare, for quick draft.

4. For this premium the committee is under the impression, that there was no mare offered deserving of premium, that came within the rules

and regulations of the Society.

5. John Ensor, for his bay mare (without name) and now in foal, is entitled to the first premium for the best brood mare for slow draft.

6. For this premium we award nothing, as it Stands precisely in the same way as No. 4.

There were however several other mares well in Maryland, was exhibited.

A number of other remarkably fine horses were worthy the notice of this committee, had they exhibited, particularly several two year old colts, not been excluded by certain regulations adopted for which no premium had been offered, the com-mittee can therefore only recommend them to the Mr. Howard, also a bay mare belonging to Mr attention of the breeders of fine horses. Mr. Jas. Fulton of Frederick, and a bay mare belonging to 500 dollars, and in one season he "cleared him-Hood's Young Friendship, calculated to improve Mr. Williamson.—Given under our hands this self."

> SAMUEL C. OWINGS. THOMAS HOOD.
> JOSEPH T. MITCHELL.

Note on Brood Mares.

A singular question arose in the committee, appointed on Brood Mares -- no other than this; whether a mare might be considered entitled to the premium, as a brood mare, that never had bred— It struck us, upon being appealed to, that there was about as much difference between a mare, and a brood mare, as between a salt box, and a box of salt-but as the point has been raised, and warmly contested, we suggest whether it may not be well for the Trustees hereafter, to require that the mare be exhibited, with one or more of her progeny? The excellence of a brood mare, depends on, whether she is a sure breeder; a breeder of good colts—and a good suckler upon keep not too expensive.

We should think it would be expedient hereafter, to offer premiums for the best COLTS, over a certain age, always having regard to the most judicious method of keeping them. At this Show, several very superior colts were taken away,

without premium.

ON ASSES AND MULES,

The committee appointed for the examination of Asses and Mules, regret, that notwithstanding the very liberal premiums offered for the best animals of this description, there was no competition for the honors intended to be bestowed. The committee have always entertained a high opinion of the utility and great importance of Mules to the farming interest of Maryland; the character of this truly valuable animal seems particularly periments made on their value and importance to agriculture, by the most judicious and experienced farmers, support their reputation for strength, economical keeping, and hardy longevity.

The only Ass entered for premium, is a Maltese Jack, named Knight of Malta, owned by Dr. Joseph N. Gordon, of Kent county, E. S. (Md.) This animal is represented by satisfactory certificates to be one of the most sure foal getters in the State, while his colts have the character of being generally well made, strong and docile.

The committee, therefore, recommend the which was the only Knight of Malta, as worthy the premium of a of the committee. Silver Tumbler, of the value of 10 dollars. And although no Mules were entered for premium, the committee were highly gratified in noticing several very fine ones belonging to Wm. Patterson, Esq. to which premiums were awarded last year; and they confidently indulge the hope, that the breeding of these animals is extensively increasing in the State, and that at the next exhibition the Society will be enabled to bestow on the fortunate claimants, the premiums so liberally designed for distribution.

JAMES SWAN, GEO. W. THOMAS, GEO. HOWARD,

Note on the Report on Asses and Mules. Were we required to select a proof of the ty, is entitled to the "Maryland Agricultural So-obstinacy and the improvidence of Maryland far-ciety's" premium, for his well broke young oxen, mers, without the least hesitation, we should say, of a silver can value of \$15. it is to be found in their failing to encourage and extend the use of Mules and Oxen. Here, for example, handsome premiums were offered for the best Jack and best Mules, and not one, bred

The Editor once owned one of the finest Jacke ever seen in any country, and stood him near Baltimore, and he did not cover one dozen mares.— He sold him to North-Carolina the next year for

For the Jack shewn now, equal to any in America, a gentleman offered \$300—yet who in Maryland ever raises a large jack for sale, though it would not cost \$50? Com. Jones has brought a very large Jack and Jennet from the Mediteranean, and has offered them for sale-he has, probably, not had a single offer, although every young one raised to good size, would, in the South, probably bring from 3 to \$500. What practical farmer in Maryland, ever was known to sell, voluntarily, a pair of large mules? Yet how few far-mers in Maryland will raise them, although every such pair, is worth at least two pair of horses !-What blindness! What infatuation!

ON CATTLE.

The committee appointed on neat cattle, re-

That the premium for the best bull over two years, of country or mixed breed, is awarded to Mr. Jacob Hollingsworth, of Woodly, Anne Arundel County, for his bull Boston. He is by Denton, a thorough bred, improved short horn bull from a cow of Devon blood:—That no bull

was offered for the second premium.

That no thorough bred bull of the improved short horned brees was offered to the examination of the committee, none of the Alderny breed, and that no bull worthy of distinction was offered,

of the Bakewell breed.

That of the Devon breed, there were several bulls of the required age, and that the premium is awarded to Mr. George Cooke.

The premium for the best bull of any breed between one and two years, is awarded to Mr. Charles Jessop, for a bull of mixed short horn breed, and the premium for the second best, to Mr. David Williamson, Jun. for a bull of the short horned breed.

The premium for the best heifer is awarded to Mr. Henry Thompson. for his red and white heif-er Fanny, by a Devon bull out of his dun prize cow. The premium for the second best to Mr. George

The premium for the best heifer under one year of age, is awarded to Mr. Henry Thompson, for his calf Sally, 5 months, full sister to Eliza, by a Devon bull out of an imported Devon cow, which was the only one offered to the examination

For milch cows no premium is awarded, because there were no certificates of milking, of the quantity of butter produced and of the keep for

thirty days, as required.

THOMAS KELSO, ROBERT SINCLAIR, HENRY CARROLL, DANIEL KENT, PHILIP LITTIG:

ON SWINE.

The committee appointed to judge of Swine,

For the best Boar, over one year of age, a Soupladle, valued at \$10, to Charles W. Dorsey, for his Boar, about three years old, of mixed Parkinson and Genessee breed. This hog seems to com-bine superior form and constitutional hardiness, with the highest susceptibility to fatten at all

ages, and little propensity to mischief.

For the best Pig, under one year of age, a Gravy-spoon, valued at \$5, to John Sullivan, for his Pig, aged seven months, from a Peruvian Sow, and got by a Cobbett or Byefield boar, not known which. This pig combines the qualities of form and beauty, with sufficiency of size and aptitude for fatness for the use of the farmer.

For the best Breeding Sow, over one year, offspring to be shown, a Soup-ladle, valued at \$10, to F. D. McHenry, for his Sow, now carrying eleven pigs out of a litter of thirteen, of uniform size and value.

For the best Sow Pig, under one year of age, a pair of Sauce-ladles, valued at \$5, to John C. Moale, for his Sow Pig, of ten months old.

Remarks:-The committee feel very great pleasure in assuring the Society, that the exhibition of Swine greatly exceed their most sanguine expectation, when they recollect that at the last Annual Cattle Show, there were scarcely as many hogs offered for competition as there were pre-miums assigned; they cann but congratulate the Society in particular, as well as the State at large, on the beneficial effects which have resulted from our system for the promotion of agriculture and rural economy

The exhibition for this year is highly creditable. For, in addition to what has been particularized as worthy of premium, there were other stock of little less value and consideration. In making their several comparisons, the committee are conscious of their liability to misjudge, and feel the utmost diffidence in the correctness of their decisions. They are free to confess that many difficulties presented themselves in several instances in forming their judgments. A white boar, entered within the rules, by Mr. N. Hoskins, of the "Pennsylvania breed," 17 months old, the committee found to be a very fine animal, and well worthy of consideration; as was also a boar of Mr. D. Williamson, jr., and another of Mr. Underwood's; Mr. Stabler, of Montgomery, also showed some fine swine.

Mr. Underwood's pig, of the boar kind, is very worthy of notice. If not successfully competing with Mr. Sullivan's, he is but little inferior.

Judge Dorsey's sow, of fourteen months, is re-markably fine, and the committee only denied an as giving evidence of being an excellent stock .-Mr. Clap showed a fine sow, of the Byefield, Bakewell, and Duke of Bedford breed; but inas-much as this animal was the native of another

Note on Household Manufactures.

it not be well at an early meeting of the Trus-transportation. tees, to appoint a committee to frame a scale of premiums for this object? Let them embrace all of the most useful articles in the household way; and make the rule imperative, that the article shall be left with the Corresponding Secretary, at least one week, before the show; and let the committee arrange and examine them on the first day of the Show; and the ladies at-tend to inspect them on the next. In fact, we are sure it would be an improvement in this case, if ladies could be prevailed upon to award the premiums, as they are much better judges than gentlemen. This is, at all events, a branch of our he knows but little of the principles of human nature, who has not learned that when you interest the ladies, you touch the spring that influences, most powerfully, all the best feelings and energies of man.

ON IMPLEMENTS OF HUSBANDRY.

The committee appointed to judge of Implements of Husbandry, beg leave to state, that they have carefully examined the several objects presented for their consideration, and although they found many that were worthy of commendation, for their utility as well as their construction, there were few that had any claim to the merit of novelty in principle. Indeed, under the proper head of agricultural machinery, there was exhibited to them but one object that appeared to unite the double claim of originality and usefulness-the patent Cylinder Straw Cutter of Mr. Eastman, which they with confidence recommend to the patronage of the publick, as the most effisient instrument for that purpose that they have yet seen.

The same gentleman also presented for their inspection, a spinning machine, which they recommend as highly valuable, in enabling families to manufacture to advantage the products of their own estates, and award to the proprietor the first

premium, a goblet valued at \$10.

Mr. Chenoweth exhibited a Threshing Machine, which from the impossibility of testing its merits on the ground, the committee are not prepared to pass a positive opinion upon, but are disposed

to believe that it may be valuable.

Mr. Richardson presented for their examina-

tion a Refrigerator, which although especially constructed for the preservation and transportation of butter, the committee would recommend as well calculated for promoting the comfort and convenience of families.

There was also exhibited a Wheat Fan from Washington county, which although it has already been noticed with high commendation by the society, they cannot pass over without adding their testimony in its favor—it is known as Wat-

kins' Fan.

JOHN MERCER, EDWARD GRAY, W. B. BUCHANAN.

to award "a premium for the best barrel of Ci-der of the make of any preceding year, of the pure juice of the apple."

the exercise of any judgment on the matter, as gallon of juice two gallons spring or pump water; The Editor claims the credit of having been instrumental in offering a large portion of the funds of the Society for improvement in family domestic manufactures—and the effect has fully equalled the most sanguine calculation. Would

> The committee regret it was not in their power to award a premium for the best sample of domestic wine, as they had an opportunity of tasting some excellent specimens of that manufac-

Mrs. Ellicott, Mrs. Hart, Mrs. Jonas McPherson, and Mrs. S. P. Walker, submitted some bottles of Currant Wine of their own manufacture; which, though varying considerably in their quality and flavour, were all excellent; -and whilst they indicate a great improvement in this branch of domestic labour, do great credit to the zeal and spirit of the ladies, who consent to become exhibition, that requires increased bounty and competitors, in this laudable attempt, to elicit attention, and more system and regularity; for he knows but little of the principles of human Mrs. Ellicott's "Strawberry Wine," was most excellent, though rather more of a cordial than the specimens of currant wine above mentioned.

The committee would respectfully suggest, the propriety at the next annual show, of giving prefermented liquors of domestic manufacture. In every point of view they are entitled to the notice and encouragement of the Society; they are cheap and wholesome-to a certain extent may George Town, D. C. running an average denth be considered as necessary in domestic economy, of 53 to 6 inches, and turning the width of 16 to every part of which they can be applied bet-feet at 17 furrows. The performance of this ter than the miserable trush imported into the plough, in the judgment of your committee, encountry and denominated, "low priced wines"; titles it to the first premium for ploughing with which is as inferior in quality and wholesomeness as it is dearer by three-fold in price. A two dollars to Jonathan Milburn as ploughman. calculation of the probable saving to the agricultural community, resulting from the manufacture we award to James Swan—the performance in by each family of a single barrel of domestic this case was with a plough made by Robert wine, would present a view of this subject, which Sinclair, of Baltimore, and running an average would surprise the most indifferent, and stimulate depth of 6 inches, and turning the width of 16 the most zealous-its political, moral, and practical influence upon society, would be more ex-tensive than at first view it would seem capable to Smith Johnson. of producing. Moreover, the attention to this description of domestic manufacture, produced by the encouragement to be held forth by the Society, would very naturally lead to the cultivation of the grape, and the manufacture of wines of a mules, and running 5½ inches deep, turned 16 higher order than those hitherto attempted in this feet in width at 19 furrows. State.

The committee forbear entering at large into this subject upon this occasion, as there are so many matters before the Society for consideration; but they trust it will not fail hereafter to the performance throughout was in their judgreceive the attention, which, in the opinion of the committee, its importance deserves, Submitted respectfully.

WM. GIBSON.

ELIAS GLENN, ALEX. NISBET, GEO. WINCHESTER, Committee on Fermented Liquors. by

Baltimore, 24th Nov. 1824.

NOTE ON FERMENTED LIQUORS .- Notwithstanding no premium had been offered, samples of Currant Wine, of various exllence, were sent by JOHN MERCER, EDWARD GRAY, W. B. BUCHANAN.

ON FERMENTED LIQUORS.

The committee on Fermented Liquors, report:

That the only-subject submitted to them, was of award "a premium for the best barrel of Circust Carrel of Carrel of Circust Carrel of C

and to each gallon of the mixture, add 3 pounds common refined sugar: put the whole into a clean (wine) cask—let it stand in the open air, shaded from the sun, until it has undergone a fermentation, it may then be removed into the cellar: the cask must be full to throw out any impure substance that will be in the liquor. In the parcels exhibited, no kind of spirituous liquor has been

ON PLOUGHING WITH HORSES.

The committee on Ploughing with Horses re-port, that Robert Sinclair of Baltimore, entered one three horse plough of his own make, without a competitor—the performance of his plough was excellent, the average depth being at least 7 inches, and turning, in very superior style, the width of 16 feet at 17 furrows. We therefore award him the first premium for ploughing with three horses. And to his ploughman, John Hillis, the premium of three dollars.

Your committee deem it proper to state, that when the several ploughs were ready to start, they caused it to be distinctly understood by the ploughman, that in their determination upon the merits of each, they should take into consideramiums for the best samples of all descriptions of tion the performance in general, without particular reference to the speed of the teams.

Jonathan Milburn entered and ploughed with a two horse plough made by Gideon Davis, of

The second premium for a two horse plough we award to James Swan—the performance in feet at 18 furrows.

The second premium for ploughman we award

Robert Sinclair performed excellent work with two horse plough, averaging 6 inches in depth, and turning 16 feet in width at 18 furrows.

Caleb Whitamore entered with a Chenoweth plough, which averaged 5 inches deep, and turn-

ed 16 feet in width at 19 furrows.

Your committee further state that although ment excellent, and the scene apparently highly gratifying to the spectators—yet the several competitors were subjected to inconvenience, and their operations somewhat retarded in consequence of the crowd pressing too close to the

twelfth of an acre. Three of the ploughs hinshed the prescribed work nearly at the same time.

That they have given all the time at their disbut the committee are decidedly of the opinion
that the team owned and managed by Mr. Marsh,
did the best work in the same time—about 25

That they have given all the time at their disthe notice. There were a variety of very beauposal to the examination of the several subjects
submitted to them; and that they regret it was
did the best work in the same time—about 25 minutes—and they accordingly award him the comparative merits of all the essays presented premium. At the same time the committee can not but express their high satisfaction with the work done by Mr. Underwood's teams—and from als, who have with so much liberality and judgwhat they have seen of this performance, they ment offered these premiums, to obtain informacan not but regret that oxen are so little used in tion from any section of our country, which might be beneficial to our agriculturists; and that the public notice of the offering of these premiums has been too short to enable many who might be disposed to write essays, to do so with the requisite deliberation and research. For the two first premiums, four essays, (on the relative value best soap—from the Editor of the American Farof the mule and horse, and of the ox and horse,) of very considerable merit were offered to the ON BUTTER.

The committee on butter award:—

For the best butter, the sample exhibited to be of a churning of not less than 5lbs. and not others to enter into competition, the committee is the best interests of agriculture will be advanced by giving their authors time to revise them, and by allowing others to enter into competition, the committee

For the second best butter, particulars as above, miums until the next annual exhibition. They would also suggest the expediency of appointing For the third best butter, particulars as above, a new committee residing contiguous to each Butter Ladle, \$5, to Mr. Edward Diven.

For the best potted butter, not less than three ed with that committee at least thirty days prior appears to the committee that the objects of For the second best potted butter, particulars those liberal minded gentlemen who have aided

On the culture of the vine the committee have been favoured with one essay of considerable inmitted for examination to the committee, which was made by Mr. Amos Tolles, of Winchester, Connecticut—and which they found superior in quality to most of the English cheese imported method of cultivating so useful an article in agriculture as the grape, the committee have decided

to award the premium offered, to the author of this essay—Mr. W. H. Tiernan.

For the fourth premium, "for the greatest quantity of useful domestic fabricks made in any family in this State in proportion to the number of persons employed," no claimants appeared, in consequence, no doubt, of the shortness of the notice.

der the persuasion that in several cases, the pro-terials, in proportion to the number of hands em-perty of gentlemen who did not wish to encounter ployed and domestic animals kept," the committhe chance of defeat, or who had no desire to tee award to Thomas P. Stabler, Esq. of Monttake our premiums, allowed their property to gomery county. The committee cannot however be exhibited in the name of their manager or refrain from mentioning, that they were most

of rearing calves by hand.

For the premium for soap, by the Editor of the American Farmer, the claimants were many and respectable, considering the shortness of the notice. There were a variety of very beauin which the committee concurred, and they have consequently awarded the premium for soap to Mrs. Sarah Hammond, of Elkridge, Anne-Arundel county.*

WM. C. SOMERVILLE, E. H. CUMMINS, THOMAS ELLICOTT, GRAFTON DUVALL, GEORGE HOWARD.

mer, by the hands of La Favette.

Note on Volunteer Premiums.

The premiums not awarded in this case, are offered again for the same objects, and the Editor takes this opportunity to invite gentlemen who are able and willing to add their names to the list, by the offer of a premium of any amount for any particular object to which they would like to prompt attention. Their offers can be added from time to time to the list, and if they can themselves excel in the particular case, it will be perfectly fair to gain their own premium. It will only be exercising the privilege of patronising the society in the mode which they may themselves prefer, instead of leaving it to the

For a special instance, suppose a gentleman has a fine horse that covers—what better can he do to raise his character as a foal-getter than by offering a premium of a cup of ten or twenty dol-lars to the owner of the best colt, got by such horse? and so in any other case where a gentleman may desire to ascertain the ne plus ultra, that can be done in any particular branch of

farming.

Rural Sports.

FOR THE AMERICAN FARMER.

GREAT SHOOTING—Washington County— against Anne Arundel and Baltimore Counties. November 19th, 1824.

Sir,—As you appear much pleased with the "increasing taste for rural sports, arising amongst the gentlemen of the country," permit a subscriber to give you a statement of the performance of several gentlemen in Washington County, Ma-

Col. F. TILGHMAN and Dr. WILLIAM HAM-MOND, after their usual dinner time in the fall, mounted their horses and rode two miles to the hunting grounds—they bagged 31 brace of par-tridges. The next evening they turned out, they bagged 29 brace-making 120 partridges in two evenings.

Mr. GEORGE TILGHMAN, in attending to the business of his farm in the forenoon, and in riding from his farm to Hager's town in the afternoon,

tridges-lost several.

the evening 13 brace were killed in about 1 hour. A SUBSCRIBER,

Richmond Races, Fall Meeting.

Commenced on the 26th ult, with sweepstakes for 3 years old colts and fillies, 2 mile heats, entrance \$100, and was won with great ease by Mr. Wm. R. Johnson's sorrel colt Janus, by Sir Archy, beating Mr. J. J. Harrison's bay colt Burstall, and Mr. Selden's bay filley Victoria. The day being bad, no note was made of the time of running the

Second Day.

The Proprietor's purse of \$300, 3 mile heats, was won by Mr. Wm. R. Johnson's bay mare Betsey Richards, beating Mr. J. J. Harrison's brown horse Aratus, at two heats. The time of running was as follows:—

1st heat, 6 minutes.

2d heat, 6 minutes 8 seconds.

Third Day.

The Jockey Club purse of \$1000, 4 mile heats, was won by Mr. Wm. R. Johnson's bay mare, entered as Janette, (now called Virginia La Fayette) at 3 heats, beating Mr. Wynne's bay mare Flir-tilla, and Mr. Tillory's bay horse Marion.

Virginia La Fayette by Sir Archy . 3 1 1 Flirtilla by Sir Archy 1 2 2 Marion by Sir Archy 2 3 3

1st heat, 8 minutes 11 seconds. 2d heat, 7 minutes 58 seconds. 3d heat, 8 minutes 124 seconds.

This race afforded fine sport, and was closely contested, the prize of \$1000 (all in American gold) was contained in a splendid purse of steel nett work; the course presented a very animating spectacle, which was enhanced by the presence of Gen. La Fayette and suite, together with a number of Revolutionary Officers and distinguished strangers, who by invitation attended and drew with them a larger concourse of people than had before attended. The General was conducted by a Committee of the Club, from his lodgings to the field, he continued in his barouche till a short time before the race; when he was conducted to the judges' stand, where he remained during the time of running, and expressed very great satisfaction and pleasure at the exhibition. the hay is thrown on the ground, which is a great After the conclusion of the race, the General and saving because he will spoil half of it, and the his attendants were conducted to the jockey club dining room, where they partook of a splendid and sumptuous dinner, prepared by Mr. James Selden, the proprietor, and given by the Jockey Club in honour of the General. Nothing occurred during the day to disturb for a single moment rushes and other matters, he refuses to eat it, the pleasures of the scene.

COMFORTS OF A HIGHLAND STABLE.

ters from the Highlands :"-

"The stable at Houna, considering that it contains nothing at all, had no positive demerits; a rare case I must admit. But if, after describing Mrs. Maclarty's kitchen, and after breakfasting, that he is turned green; and as he will become dining, and sleeping at her hotel, I were not to greener every day, since a curry-comb was never lead you into the stable of a Highland inn of this heard of in Mr. Maclarty's stable, the prudent class, I should be unjust to the fair sex; as it thing is to paint him green before you begin. A must be supposed that this department, however whisp of straw might have been substituted, you indirectly, is under the controll and management will think, for the curry-comb: but the knave of Mr Maclarty, not of the lady. If you succeed trusts that the next shower will do as well. The in reaching it, it must be through a pool of mud mane, of course, is matted by the fairies; for how and water, and other indescribables, and it will else should it have become so inextricable that be fortunate if they are some stepping-stones for the fingers of this bare-headed kilted called with

In the morning but few birds were found-in yourself: more forturate, if your horse does not not make it lie in any direction-even in a wrong dry on his legs; and to pick or examine his feet Mark-lane and the Hay-market. would be troublesome. If the thatch is water Such comforts may be realize tight, so much the better. A hayloft is a luxury: ling for them to the Highlands of Scotland.] and as there is no stable lantern, the hav hange down among the loose boards upon the candle; but, being damp, there is no danger. The boy goes up to stir it about, and you are covered with dust and chaff. So is the horse, and as he is not wiped down, and there is no horse cloth, that helps to keep him warm. Since the Scottish reformers pulled down the stalls in their churches, they have probably thought them unnecessary in their stables; but a few saddles and pikes and poles and wheelbarrows and horse collars, with a stray pig, a hen and chickens, and a calf, serve, at the same time, to wedge him up, and to prevent him from being dull. It is likely that you will object to the society of half a dozen sharp-horned stirks and stots; but what then? If you think it prudent to tie him up, under these circumstances, or because the house is filled with Highland ponies justling and squabbling and kicking in every direction, there is no halter. You may use your bridle, which he will break; or if you insist on a halter, a rope will be found before to-morrow, and made fast round his throat with a slip knot; so that it is not unlikely you will find him hanged the next morning. If there is a manger, probably the corn is put into it; but it is either full of It is hoped that gentlemen in the country will endeavour to holes, so that the oats run through, or so high that he cannot reach them. If there is a rack, then receive their Diplomas; and those only have a right to the hay is thrown on the ground, which is a great participate in the proceedings, who pay \$5 per annum. saving, because he will spoil half of it, and that will serve for his bed. That, with his own produce, is probably the only bed he will get; but, being added to the former beds of former horses, it serves to keep him moist and cool. You begin by giving him hay; but as it is made of musty bable that he will determine which is worst when he is hungry enough. A highlander ostler of this The following account of the stabling and family is a great enemy to false delicacy; theregrooming horses in that part of Great Britain fore begin your journey by bronzing your stirrups called Caithness, is from "Dr. Macculloch's Let- and bridle; it will save remonstrance. When you are about to depart in the morning, you must not be in haste; because your horse is neither fed nor watered, nor is likely to be, until you do it yourself. If he is a gray horse you will find

trip on them, and souse you with the perfumes of one? If he possessed the luxury of a comb of this moat. If he is a tall horse, not understand- either kind, it is probable he would use the one ing architecture, he will knock his head against to straighten his own locks, and the other to claw the door-way; and if you have the misfortune to his own hide. When your saddle and bridle are carry a portmanteau, as may happen to single to be put on, you will find that they have been gentlemen, he will stick in the passage, and pull lying in the dirt all night, as there is no peg to off the straps, which there is no saddler to mend. hang them on; and in a well-regulated stable, it When you get in, you find two or three holes in is held matter of policy to keep some wild colt or the wall, for the sake of ventilation; so that on filly loose, who walks about in the night, trying Mr. Coleman's system, he cannot catch cold. If to purloin the hay and corn of his neighbours, you do not keep an eye on him, you will shortly having none of his own; so that, if you sleep find him swilling water out of a bucket, or in the near it, you are regaled with quarrelling and nearest river; and the next morning he is foun. dered; and so are you When he does want wa lock the stable door; yet not till you have paid ter, as there is seldom a pail, he is dragged out the breechless lout as much for doing nothing, as, by the mane to the river; and if he breaks his in London, would have polished horse, bit, and knees among the rocks and stones, he is used to stirrups; to the lustre of the planet Venus; and it, or else his fraternity is, which is the same thing. twice as much for musty husks and mouldly rush-It is reckoned politic here to suffer the mud to es, as would have procured all the luxuries of

THE FARMER.

BALTIMORE, FRIDAY, DECEMBER 3, 1824,

THE PRICES OF COUNTRY PRODUCE.

We have taken the round of the wharves to ascertain if there be any change, worthy of note, in the price of the articles usually quoted in the American Farmer. The result is, that, as to To-BACCO, there is nothing doing; no sales-Wheat is dull, and flour much on hand and little doing-Red Wheat may be quoted at 90 to 95 cents-

Wharf Flour at \$4.623, 90 days credit.
The staples of North Carolina—Cotton, Turpentine, &c. remain as last quoted, and in general there is no change worth stating-Oak Wood from \$3 to \$3.50-Pine do. \$2.25. There are at the head of the Basin, we should think, not less than from 3 to 400 Bay Crafts.

The Maryland Agricultural Society will meet at Car-

A desirable Farm for Sale.

The subscriber will dispose of from 300 to 500 acres of the well known FARM, on which he now resides, lying on West river, in Anne Arandel county. This portion has attached to it all the buildings necessary for the accommodation of as expecting corn. But if you begin with corn, as many servants as could be advantageously employed in its cultivation, and for the curing of 40 hogsheads of tobacco. About 250 acres of the tract is now in a highly productive state, and the whole can be enriched to almost any extent, as there are inexhaustible banks of oyster shells situated in the most convenient position to the principal fields. He would gladly also dispose of to the purchaser of the farm, at very reduced prices, a number of healthy, intelligent, and well brought up SLAVES.

Letters addressed to him at Annapolis, will be promptly attended to; and those who are desirous of communicating in person, will find him at his residence on West river.

AND GENTLEMEN OF THE SOCIETY :-It is an axiom in political science, that in every well ordered community the agricultural, manufacturing and commercial classes ought to exist, efforts, interchange of ideas, and the mutual communication of discoveries. One of the various terials with which the others work, and the food of all:—the second prepares these materials for of all:—the second prepares the secon or all—the second prepares these materials for the use and enjoyment of man:—and the third circulates the surplus products of both; thus enabling every individual to turn his labour to the best account, by exchanging it for such products of the world, as his necessities his gratification or his converged as his necessities his gratification or his converged to the surplus products of both; thus enabling every individual to turn his labour to the best account, by exchanging it for such products to me, they have, I fear, formed much to which it is for the nourishment of those plants to favourable an estimate of my attainments, in this department of knowledge. If fondness for leave the land after a crop much less fit for it than agricultural pursuits, and a deep conviction of before. But this land may, and almost always nience, may require.

food, and working up the raw materials for his I may be able to suggest, which perhaps may land, by a careful attention to manuring, becomes clothing and other uses, machinery is employed lead to further enquiries, and point the way to again replenished with the ingredients suited to to a greater or less extent; which enables a comuseful improvements. To this I shall confine my the first and other crops in the rotation. Thus to a greater or less extent; which enables a com-paratively small number of individuals, in every community, to perform all the labour of this demuch facilitated by the mechanic arts, and may be done by a few persons. But agricultural labour must be performed by the hand of man, with the assistance of those domestic animals with the assistance of those domestic animals. This view, restricted as it is, embraces so great of crops, will be unavailing, unless we are carefully the most skill be unavailing to the most skill be unavaili

Nor is it less so, in its tendency to promote the physical and moral excellence of our species .ing, instead of the tainted atmosphere of a manufactory. His limbs are continually in free and active motion, instead of being confined to a workbench, or a loom. He has constantly before him the beautiful and magnificent spectacle of nature, ever varying yet still the same, which leads him to the contemplation and worship of Nature's the same, the situation as regards the sun and the greater or less elevation of the selection of remitted attention. In a two great agents in its accomplishment are irrigation and manuring.

But few farms are so situated as to possess, in a high degree, the advantages of irrigation.—

They are, however, much more general than is to the contemplation and worship of Nature's the same, the situation as regards the sun and the greater or less elevation of the thing to the fertility of some portion of the soil God, and cherishes every noble and generous sentiment. He derives his subsistence immediately free and happy government, Vol., 6,—38.

And yet this pursuit, noble and enobling as it But still much may be done, by careful attention is—this pursuit which is not less conducive to the to this subject. Two neighbours, who have farms dignity and happiness of man, than necessary for of different soils and exposures, may often exhis subsistence, which occupies four-fifths of this change products with each other, so as to enable and every other well constituted community, has both to cultivate to greater advantage. The same every where received less public attention, coun farm frequently contains a variety of soils and extenance and support, than any other branch of posures, a strict attention to which will enable industry. Those who are engaged in it have generally been left to grope their way in the dark; perfectly, at least to a very great and beneficial to overcome obstacles by their individual efforts; extent. To this end, it behoves him, not only to to find out errors by the experience of their in-jurious effects; and to rely for their correction, as well as for the discovery and introduction of ed by experiments, reading and observation, with improvements, on single divided and unassisted the nature of different crops, and the manner in

which he rears and feeds. Mechanic art gives it some, but very little, aid. Consequently it must be omitted, and but a few brief the nurture of her various productions, which are employ great numbers, the great mass of every community: and in this respect, also, agriculture is the most important object of human pursuit.

Notice it less to in its tendency to promote the largest of the sistence of those differences as it is, emoraces so great of crops, will be unavailing, unless we are careful to return to the earth those ingredients, fitted to belong to it must be omitted, and but a few brief the nurture of her various productions, which are remarks, little more than a bare enumeration, used up and exhausted in the act of producing.—

can be given to the rest. Hints for reflection are all that I can aspire to: happy if they should exhausted, and fields once fruitful become barren.

Notice it less to in its tendency to promote the largest and its standard to return to the earth those ingredients, fitted to return to return to return to the earth those ingredients, fitted to return to return to the ea

which each is affected by the qualities of the soil, It is the object of our Association, to correct, as and the situation of the ground. This is a funfar as possible, this state of things, and to give damental point in agricultural science, to which agriculture that aid which is derived from united the practical farmer cannot pay too much atten-

agricultural pursuits, and a deep conviction of before. But this land may, and almost always their importance to the prosperity and happiness does contain, in a greater or less degree in pro-Hence it results, that of these three pursuits agriculture is far the most important, and must employ much the greatest number of persons.—
The first necessity of man is food. Next in importance are the materials of which his clothing, and all his other accommodations are made. Both of these depend on agriculture. In preparing his first and an agriculture. In preparing his food, and working up the raw materials for his least and working up the raw materials for his least and an agricultural subjects, which alone could enable to suggest, which perhaps may lead by a careful attention to manuring, becomes endeavours, leaving to skilful and experienced it is always employed in producing that crop, with agriculturists the more important and difficult the proper ingredients of which it is most plentiscription, which its wants or its comforts require. task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting task, of guiding the practical farmer in the defully supplied; while it is constantly recruiting tasks and the defull supplied in the practical farmer in the defull supplied is the practical farmer in the defull supplied in the practical farmer in the defull supplied is the practical farmer in the defull supplied in the practical farmer in the defull supplied is the practical farmer in the defull supplied in the practical farmer in the defull supplie

prove of some use, in leading to enquiry, or point- wastes. In giving her this constant supply, in physical and moral excellence of our species.—
The agriculturist is employed in the open air, instead of being shut up in a close and crowded room. He inhales the pure breezes of the mornme first to call your attention to the selection of remitted attention. The two great agents in its

wind, and the greater or less elevation of the thing to the fertility of some portion of the soil, ground, will render one spot much less favourable. The manner in which streams may be conducted timent. He derives his subsistence immediately from his own exertions: his mind is directed to a great variety of operations, instead of being confined to one or two; and where, as in our happy country, he cultivates his own soil, reaping for himself all that he sows, and enjoying all the fruits of his own industry care and foresight, instead of toiling for a bare subsistence, to promote the wealth and supply the luxury of another, he feels a proud and lofty spirit of independence, which elevates him in the scale of being, and fits him to fulfil with dignity and effect his high duhim to fulfil with dignity and effect his high dumust embrace in his own cultivation almost every along the hill side, will in a few years convert a ties, as one of the members and supporters of our product which his consumption requires, however barren sedgey old field, into a most productive free and happy government.

done by turning currents of rain water over the fields, and especially over grass lands. They al- flesh, with the smallest quantity of food. In this ways carry with them more or less of fertilizing matter. The wash of roads is particularly valuable, in this way. I can here again speak from quently, that the largest and most showy are not Good shelter, protection from cold, and more esmy own experience, of the beneficial effects of always the most valuable. these practices. I have on my own farm a small piece of grass land, originally very barren, which has been rendered highly productive by turning for strength, can be kept in good condition with milch cows, young calves, and fatting beeves, so over it the wash of a road. The fine particles of the smallest quantity of food, requires the least constructed as to surround the barn-yard, shelter earth carried down by the rain, from such places, appear to be extremely fertilizing, especially for grasses.

To dam up small streams and gullies, so as to collect the fine earth which the rain brings down them, is also a very cheap and beneficial practice, of which I can attest the advantages. The matter thus collected is a very fertilizing manure; and they who have not witnessed it may find a difficulty in believing, how large a quantity may be collected with very little labour, in favourable situations; which are much more numerous and easily found than will readily be supposed, by those who have not attended particularly to the subject. Hardly any farm is without them.

On the benefits of manure it would be super-fluous to dilate. They are acknowledged by barn-yard is indispensable. It should always, where practicable, be formed on sloping ground,

of stock, will produce but a scanty supply of maa farmer's attention. To prosecute it successfully a selection of the best breeds, in the first place, tending to the blood, figure and size of the sire and dam. Their qualities are also acknowledged as well expect to produce fine wheat from inferior seed, or fine apples from grafts of an inferior tree, as fine cattle from a bad stock.

In selecting the stock from which we shall

properties of the different races, as well as to the mode of profit which we have in view. Is it our object to raise and fatten beef for the market? I have said that without good keeping, all other this system. This is not the place for entering We should choose a race which fattens easily, care will be in vain. For them I refer you be found without an apple orchard, or even a few again to the publication which I have already had trees to furnish fruit for the table. Its last progeneral prosperity, will be very much increased as well as our prudence and our economy, and by attention to some other objects, which, alought to induce every friend of religion and vir-

deserving of his care. Among them I will brief the same argument pleads strongly in favor of the vine, which is less known, less easily understood or managed, and consequently requires greater efforts to secure its successful introduc-

tions for the proper selection for different soils and

In speaking of the general means of improving agriculture, roads and canals must not be omitted; nor ought we to forget how great an effect might be produced, by the establishment in a suitable situation of a pattern farm, where the best animals of every breed, and for every purpose, might be brought together, for constant inspection as well as propagation; and every new improvement in tillage, husbandry and agri-cultural instruments, might be subjected to the test of experience. This is an object worthy of the munificence and patronage of the state government. Perhaps without such aid it cannot be accomplished. Yet something might be done by individual exertions, and all may unite in the endeavour to give a favourable impulse to public opinion, by which alone the assistance of the government can be secured. It is one of the advantages of our political institutions, which may sometimes be felt as an inconvenience, but in its general operation is our best security, that our governments rarely lead, but never fail to follow public opinion; and, indeed, do little more than give a legal sanction, to that which the public will has previously resolved on. Hence it is necessary, in originating any great system or measure, to mon food, and of their wool for common clothing, an object of profit. The trees are easily raised inlist public opinion in its favour. Let this be our endeavour, in relation to the establishment of a pattern farm, on a suitable scale, by the aid of the public purse; and to legislative encouragement in various modes, to agricultural improve-None of the breeds, however, will be profitaof cattle, they do not prevent the land from being agriculture, while New York, Massachusetts, and agriculture, while New York, Massachusetts, and so many other states, are reaping a rich harvest, from their liberal and enlightened measures for its encouragement. Let us hope that a new era should be calculated to keep them dry and clean, which nature than to keep them warm, for which nature which the apple is used, the length of time for unite heart and hand, each according to his means has most abundantly provided. Nor ought less which it may be preserved, after all other fruits and opportunities, in hastening its auspicious apattention to be paid to their food, both in winter have failed, the number of wholesome and palataattention to be paid to their food, both in winter have failed, the number of wholesome and palata- pearance: in hastening the time when the govand in summer. Dry pastures are indispensable, ble dishes into which it enters, and the healthy and ernment of the state shall take the lead in promoting, by the liberal application of the public means, the great public work of agricultural improvement. So of roads and canals, which conduce most powerfully, though indirectly, to the same great end. occasion to mention, and which, as a source of useful information on agricultural subjects, I cannot mention too often, or too earnestly recommend.

The comforts of the farmer, and of course his curse of the land, recommend it to our patriotism be greater or less. In this proportion, more or be greater or less. In this proportion, more or less labour and capital will be withdrawn from transportation, and applied to production. Subpose that every farm in Maryland were brought one half nearer to market-Does not every one see that its value would be greatly increased?-Yet this is the effect, or rather it is not the full effect, of good roads. That of canals is four or able; and hardly any farm is destitute of a toleration. Little has hitherto been done, in the culti-five times greater. Look at New York—In the bly good situation for both. d, do 28 to agriculture and the public prosperity, are too mighty for individual strength. They belong to the arm of government, by which alone they can be effected. They are for the good of all, and the are parts of this whole, by which so much may though sad conviction, of having failed by the fault of others, and not through our own laxity of exertion, or want of patriotic feeling.

TO THE EDITOR OF THE AMERICAN FARMER.

Vineyard, near George Town, D. C. Nov. 20, 1824.

DEAR SIR,-Upon my receiving the enclosed from my valued correspondent, Thomas Mc. Call, Esq. of Georgia, I was satisfied that I put near double the quantity of sugar necessary into my wine, and I was obliged to put into some of my casks, a quantity of crude tartar to excite a new fermentation, so that it might decompose some of the saccharine matter that was in the wine that it might become alcohol, and take off the sweetness and to make it more dry, but I only partially succeeded, for my wine is generally yet too sweet for such persons who are in the habit of drinking Madeira and other dry wines; and my correspondents very frequently enquire of me-Why do you put sugar in your wine? And say—you will never make good wine, until you cease adding sugar to it. Notwithstanding which, my wines are generally acknowledged to be very good, except by such persons whose tastes are vitiated by drinking of strong foreign dry wines; while those persons who are clear of prejudice, inform me, that they can drink much more of my wines, with less symptoms of intoxication, than they can of foreign white wines or Port, and that they are much better after it.

And I am certain that it is folly itself, to pretend, or expect to make good wines where there is not a sufficiency of saccharine matter, either sugar, or something equivalent in the must of the grape. I have therefore endeavoured to fix upon a standard, so as to give my wine a certain strength or body, to keep after it is properly manufactured, for an indefinite length of time. And in all countries where there is not a sufficiency of saccharum wet seasons or otherwise, they boil down the nations who make wine, with the intention, either the sweet principle necessary to make wine to to inform you of the result, and I hope others will to to keep in their own vaults for an indefinite time, keep in their own vaults for an indefinite time, keep in their own vaults for an indefinite time, to trouble the reader with the result of them.

I then bruised a small quantity of grapes from those gathered to make wine, on different days, and the subject, that eight tenths of all the wines and some were more ripe than others, and by taken place, as all the saccharine matter that is

were to be had, it would be difficult for some grains in the other .- To elucidate this I say, as persons to use them; I have therefore resorted two ownces is to seventy-eight grains, the deficithe must of the grape, from which a calculation the whole quantity in a gallon deficient, viz. 4992 be done, and without which nothing can be done. may be made to ascertain its specific gravity,— Let us act each man his part, with vigour and di- and which I believe, will answer all the purpo

> I then took eight hundred and seventy-five grains ought not to be less than 1125.
>
> of rain water by weight, at the temperature of The reader will bear in mind, that there is not of rain water by weight, at the temperature of 60° of Farenheit's Thermometer, and then with a sharp file marked round the vial exactly at the but only such a proportion as where three pound one gallon of water, and carefully dissolved it in the water—I then filled the vial with this mix-ture, exactly to the mark I made when the rain water was in it, and weighed it carefully; and this quantity of the mixture weighed nine hundered and eighty-four grains—I then by the rule The writer of the enclosed, Mr. to make wine to keep for an indefinite length of Adams, but I have not had an opportunity of en-

To exemplify this experiment, I make the following statement :-

There was of rain water 875 grains. double refined sugar 328

Total weight of the mixture 1203 do.

Two ounces of the mixture by } measure weighed } 984 grains.

The sugar increased the quantity of fluid more than reached to the mark in the vial 215 grains.

Making in all 1199 do.

in the must of the grape, whether it be owing to in the operation, and I found the specific gravity they will have a beverage equal to most Chamof lump sugar, the same quantity as in the first

bute his mite towards the formation of a public sentiment, favorable to public improvement, by governmental means. Like the widow's mite, it will be blessed to him in its fruits. Still more it will be blessed to his country, and his country will bless him in return. These great works, which powerfully promote the improvement of agriculture and the public prosperity, are too agriculture and the public prosperity, are too the cost of them is also considerable and if they of seventy end if the cost of them is also considerable and if they of seventy grains of sugar, and of forty-six the cost of them is also considerable, and if they of seventy-eight grains of sugar, and of forty-six means and efforts of all ought to be united, for to another mode of arcertaining the quantity of ency of sugar to one gallon, so is one hundred and their accomplishment. Let us not forget that we saccharine matter contained in a given quantity of twenty-eight ounces, the weight of one gallon, to grains, which is equal to 11 ounces and forty one be done, and without which nothing can be done. may be made to ascertain its specific gravity,—
Let us act each man his part, with vigour and disagree. We may do much towards commanding sees of a saccharometer, and is so simple that any success, and if we fail, we shall have the proud person may comprehend and practice it.

| Additional contents of the deficiency of an ounce, or very near eleven and a half ounces, avoirdupois weight, to one gallon; and the deficiency of forty-six grains in the two Experiment 1st .- I took what is called a two ounces is equal to six and three quarter ounces, ounce vial, with a cork, and then made a small very near to a gallon of must, to be equal to bag, into which I put small shot, so as exactly to three pounds of sugar as above mentioned, to probalance the vial; the bag was made to save the duce a specific gravity of about 1125; and I betrouble of weighing the vial in every operation. lieve to make wine to keep, the specific gravity

> height where the water reached-I then took is dissolved in a gallon, as the sugar added inthree hundred and twenty-eight grains of double creases the quantity of fluid from seven to eight refined sugar, which is equal to three pounds to per cent. But I am of opinion that it will be near

The writer of the enclosed, Mr. Mc Call, sent of three say, as 875 grains of rain water is to 984 grains of the mixture, so is 1000 grains to its specific gravity, viz—1124 57-100.—This proportion of sugar I look upon to be the least quantity of saccharine matter, substance, quality or and Rhenish mixed,—part of the bottle I left sweet principle necessary in the must of the grape with our Secretary of State, the Hon. John Q. quiring of him what was his opinion of it.

JOHN ADLUM.

Note.-The weights I made use of was the avoirdupois weight, viz. seven thousand grains to a pound, four hundred and thirty-seven and one half grains to the ounce, and sixteen ounces to the pound.

As there is a good deal of cider yet to be made in our Country, I would advise gentlemen to try the weight of the must, and add sugar or honey, to give it a proper specific gravity, according to the rules above set down, and attend particularly to funigating the cask with sulphur, and rack and fine it after it has gone through its first fer-mentation, and bottle it either in March or June, Which, taken from 1203 grains, the total weight and communicate the result to the American of the sugar and water, leaves a loss of four grains Farmer next year, &c. and I have little doubt, but paign, and if it is too strong to drink in a tumbler, must to a consistency like treacle, to mix with experiment, to be 1127, and the loss in the opetheir wines, others add honey, or brandy, and ration to be ten grains, which I attributed to the this idea, was a present of a barrel of crab-cider, some add both to give it a body so as to keep, exercise of carbonic acid, and there was also a resent me by my neighbour, N. Lufborough, Esq. cept by the French and Germans; and notwith sidum of lime. The India sugar, such as is which was clearer and had less mucilage in it, standing what people may say or think on this subject, the best Champaign I ever tasted, had the same as in the operation with the double rether honey flavour, and I have no doubt it was ad-fined sugar. I found exactly the same result, viz. must I had from the grapes this year, viz.—two ded to it. And although there is no people who the specific gravity 1124 57 100, and the loss in ounces by measurement weighed nine hundred make wine, honest enough (except the Spaniards the operation four grains.—

I also tried at the rate of two and a half pounds four gallon; but as I sugar to it, which is a small fraction more than doubt but that it is more or less practised by all believe three pounds to be the least quantity of 6 3-4 ounces to the gallon; and if I live, I intend

decomposed and becomes alcohol, will cause it to be lighter, until all is decomposed, when it will be specifically lighter than rain water.

P. S. I hope when you have leisure, that you will give Mr. Mc Call's letter in toto, as I am sure that it will be very useful to the public, and I feel much indebted to him for the valuable information that it contains. *

I have not yet had leisure to try any experiments on the milk, but intend to attend to it towards the last of the week.

N. B. Some persons may object to the expense of the sugar, but if it renders the cider so much better than it would be without it, and enables you to add when you are using it, one half or nearly so, of water, or possibly an equal propor-tion, I think it will be money well laid out, as the sugar will not cost more than two dollars if the cider is good.

* This letter, if sent to the Editor, has been mislaid, and when recovered, shall be published.

As to the milk, our request to Major Adlum was to weigh the milk of different cows, that we might understand the language of the Eastern be well too to ascertain, whether a given measure of one cow's milk being heavier than another, the yield of butter is proportioned to the difference

Politicks of Agriculture.

SHEEP-KILLING DOGS.

[The subject of the following communication is one of too much importance to the farmers of Maryland and other states, to be much longer neglected .- The evil of sheep killing dogs, amounts now to a shocking, a dreadful grievance! and Legislators must apply a remedy or subject themselves to the charge of a scandalous neglect of one of the most important concerns of their constituents. There is no species of cowardice so prejudicial to the publick, and none therefore, should be held, in the publick esteem, so disreputable, as that vulgar fear of popularity, which restrains men from the enactment of laws which are indispensable for the general good-in the apprehension of losing a few votes here or there! Yet has this ignoble apprehension been the bane of enlight. ened legislation in Maryland for the last twenty years. It is impossible to suppose that those entrusted with the powers of legislation, can be ignorant of the great detriment to the agri-cultural interest which arises from the constant liability of every farmer's sheep to be killed by dogs-not only the number of sheep is diif those whose duty it is to provide a remedy, require to be spurred, let the farmers in every County get up a petition, "that your honours will provide such guards and penalties for the preservation of sheep from dogs, as may be

TO THE EDITOR OF THE AMERICAN FARMER.

SIR,-In your late numbers you have emphatically called the attention of your readers to a subject of great importance to the farmers; and considering the common wish to promote the household manufacture of woolen articles, it has become interesting to the whole community. The subject alluded to is the frequent destruction of sheep by dogs. This evil has increased so much, and is still so much increasing, as to demand the ever she chooses to lead; and the number inearly attention of the legislature; and it may be hoped that immediate efforts will be made by the members of the several Counties to ascertain the extent of this calamity, and to reflect upon the means by which it may be restrained. My mind pursue; they become excited to frenzy by the has been engaged by the various mischiefs occa- wounds they receive and the rivalry which goads sioned by dogs for many years: an attempt was them on; and they are ravenous for want of food once made in the House of Delegates to provide a remedy by the imposition of a tax; but it was flock by which they pass is in the utmost danger; opposed by certain members out of respect to the fox-hunters, and did not succeed. It too often ny sheep are captured and destroyed. It is prohappens that, though provisions in certain cases bably on such occasions that many dogs acquire are admitted by most persons to be necessary, few this destructive habit; and when once initiated, individuals are found willing to bring them for-ward; and the suggestions of any one person who Cattle Show reports, where they say a cow gave may venture to recommend a measure are treso many hounds of milk, in such a time.—It would quently disregarded. The short, but pointed tion of dogs after having followed a gipsy for semantic to the secretain, whether a given measure manner in which you have expressed yourself convention to the secretain and wounded the lankness of their bodies for cerning the destruction of these valuable animals, and wounded, the lankness of their bodies for and solicited your readers to disclose a proper want of food, and the extreme irritation to which remedy to prevent it, has roused the attention of they must have been roused, it has been long my your subscribers in this County, and probably in belief that these excitements constitute an origiother places; and by your instrumentality, the nal cause of canine madness. This belief may be time perhaps has arrived when the observations submitted to the judgment of those who can rea-of an individual may be read with patience, and son upon such a subject: but if it be even possiproduce such reflections in the minds of others ble that the sufferings of dogs in such pursuits as may lead to wholesome and efficient provisions, may produce a distemper so horrid in itself and In discussing such a question it will be necessary so deplorable in its consequences, this considerato use terms which would be offensive to delicacy tion ought to have the strongest influence upon if they could be well avoided: and to give the our endeavours to diminish their number, and recure its full effect, it will be requisite to compre-strain their power of committing injury hend the case of all persons without regard to The sportsman's dog is as prone to kill a sheep,

year, and to make an alphabetical list of all per- ter a certain prefixed day, so encreased as to act as County on or before the first of June, to be laid be imagined. before the Levy Court. Duplicates of these lists should be delivered to the collector, who should be required to charge and collect the taxes in the same manner as the County assessments. The constables should be subjected to a penalty for neglect of duty; and should be allowed a fee of twenty-five cents for every dog or bitch truly returned by them, to be levied and collected for their use in the assessments of the County. The cided taste for rural sports, particularly the man-master should be charged with the tax for every ly and healthful exercise of Partridge Shooting, dog or bitch which he should allow his servant (which, in fact, I regard as one of the accomplishor slave to keep, harbour or own. It should be ments of the country gentleman,) and having purthe duty of the constable on his own view, or on sued it with great zest for about thirty years, I the duty of the constable on his own view, or on the information of others, to kill and destroy, or cause to be killed and destroyed every dog or bitch which any free negro or mulatto should keep, harbour or own without the license of a magistrate regularly renewed according to the Act of November 1806, ch. 81. If so licensed, the dog or bitch to be taxable, and returned like those of other persons. The owner or keeper of any bitch, who should suffer her to go at large during a season of oride, should be subjected to a penalty; and town should elect to pass ordinances imposing the like taxes and penalties, and containing the like provisions, then the monies so raised should be applied to the benefit of such towns and cities. These regulations might be qualified by a proviso, that all castrated dogs should be exempt from that all castrated dogs should be exempt from prospects for the next are all that we could wish."

I have been perhaps too particular in stating the grievance we endure, and in suggesting the remedies which may tend to diminish it. But it is felt severely; and these observations may excite the inquiry and stir up the reflections of other farmers; and if suitable provisions can be made to preserve our flocks from these destructive animals, I trust the members of our Legislature will have the wisdom and firmness to enact them without regard to the prejudices or clamour of any class of individuals.

I am, Sir, respectfully, Your obedient servant, St. Aubin, Talbot Co. N. HAMMOND. Md. Nov. 20, 1824.

sons keeping, harbouring or owning any dog or a preventive.—Making the amount so large as bitch, and to set down the number of each kind; that few persons would encounter the expense which list he should return to the Clerk of the of keeping one. The consequence may readily Respectfully yours,

MACHINE FOR RAISING STUMPS.

[The valuable communication which follows, was obtained by Mr. Prince, of Massachusetts, from the writer in New-Hampshire, in consequence of a request for information, expressed through this journal. The information thus obtained from one end of the Union is printed here, in its centre, and then diffused through every State and Territory for practical use and general benefit. It is one case of a thousand, that illustrates the value of a National Agricultural Journal.]

Meredith, (N. H.) Nov. 17, 1824.

JOHN PRINCE, Esq.

Dear Sir,—I cheerfully comply with your re-quest for a description of the machine for extractng stumps, as used in this vicinity. The only one in my immediate neighbourhood, was constructed for Daniel Avery, Esq. of Gilford. It consists of three wheels; two on an axle eight feet and an half between the naves, twelve feet in diameter. The third, is framed into the axle one foot from the nave, and is eight feet in diameter. The axle is about twelve inches in diameter, and at the centre, a strong staple with a hook appending to it. To this hook one end of the chain is hung, while the other is put about the trunk or root of the stump to be raised, as its size shall determine. The chain that wraps the stump should be large and of good iron. The one here in use, weighs about one pound to an inch, and the wire is nearly, or quite, one inch in diameter. Notwithstanding this size, it has often been broken. The power of the machine is put in operation by ma-king a chain of a small size fast on the centre wheel, and to this apply your strength. One yoke of oxen is enough to work the machine, and on plain land it is usually moved by men. Four hands are necessary to its operation, and this is sufficient to take up an acre in three or four days, depending on the abundance or scarcity of stumps.

The land on which this machine has been used, is plain and rather sandy, therefore, the trees rooted downward rather than spread off broadly. On clayey ground, the roots extend much further abroad, and an axle of this length would not be long enough to work with convenience. Another the outside wheels fourteen instead of twelve feet, and the inner one ten instead of eight feet. The axle should be at least fifteen inches in di-

indulged than those of national pride. An impassing through the centre of the axle at right angles, with two inch plank framed into these the distance, from Whitehall, round the frigate Hussar at anchor in the North River, and and a half board, to keep the chain about the back to the place of starting. There is a great excitement, but no unmanly feeling. It is mutually agreed, that the winning, shall treat the losing party to an entertainment. This is as it should be, and we anticipate no debasing conducts.

Inch and a half board, to keep the chain about the wheel in its proper place. Inch and a half in diameter, or perhaps inch and a quarter cordage, would answer the purpose, probably more contoning party to an entertainment. This is as it should be, and we anticipate no debasing conducts.

Inch and the centre of the axle at right angles, with two inch plank framed into these shafts, or arms, and on each side plank, an inch and a half board, to keep the chain about the wheel in its proper place. Inch and a half in diameter, or perhaps inch and a quarter cordage, would answer the purpose, probably more constituted in the same, some the purpose and specific the naves and spokes are white oak, the fel-

A direct attack upon the dogs in our State, would almost create a civil war; it would at least cause a turn out. Suppose we attack the dogs through the sluts. Few persons like to have a slut about their houses; and therefore few would be roused by a tax on them. This tax, if thought be skilled 29 birds in succession.

On either side.

FOR THE ELECTION OF OFFICERS, &c.

Agreeably to public notice, in the American
Farmer, and the several newspapers in Baltimore, the Maryland Agricultural Society met at the Fountain Inn, in the city of Baltimore, on attention as President of the Society, and that the A. M. for the election of officers, and for the him of the same."

almost exclusively of substantial, practical farmers, many of whom came in, from the distance
of fifteen miles, and in every way manifested an
earnestness of design, and real solicitude upon
the subjects that were brought under consideration, which gave the assurance that the farmers
now see the bearing of this society, upon the
great objects of their pursuits and labours; and
that they are now resolved to take it in hand,
that they are now resolved to take it in hand,
therish and support it, and turn it to the best that they are now resolved to take it in hand, therests of this State.

The Society met, the day in course, when the crests of this State.

A resolution was passed, instructing the Coraccount; and this is all that was necessary to ensure for it, the beneficial effects upon the landed interest of the state, for which it was originally instituted. We trust there will be no society; and the Treasurer was required by a from the President, on the subject of experiments and labours; and the state, for which it was originally instituted. We trust there will be no society; and the Treasurer was required by a from the President, on the subject of experiments and labours; and labour originally instituted. We trust there will be no relaxation of activity. Let the gentlemen, to whose management the concerns of the society have been committed for the next year, feel, and act upon that feeling, that the trust they have upon that feeling, that the trust they have ned to posterity—that it is one of great respectability, and of the more honour, as its only reward is the consciousness of promoting and doing good, in the most important concern of human life—the cultivation of the soil, to produce the very means of our subsistence, and of all our conforts. Let no trustee be satisfied with waiting for the time in the concerns of the society; to call on the President, the Treasurer, was required by a resolution of the Society, to call on the President, ments made with plaster paris and clover, was required by a resolution of the Society was red; the Collector, and each one of the Trustees of the Society, to call on the President, the Treasurer, the two Secretaries, the Collector, ments made with plaster paris and clover, was required by a resolution of the Society was read; which, together with communications submitted by O. B. Ross and D. A. Deaderick, at a former meeting was ordered to be transmitted to the editors of the American Farmer, American Economist, Knoxville Enquirer and Knoxville Register, for publication. Thomas G. Watkins, M. D. President, having declined a re-election, put in nomination the name of Thomas Emmercultivation of the soil, to produce the very means of the Board of Trustees, to letter the following officers and committees were unanimously elected to serve for one year. of his own estate, and the welfare and character of scribers. those who are to come to its enjoyment after him. When ever any thing occurs to him, that one of the by-laws of the Society: he may think would be useful in promoting the objects of association, let him commit it to paper, or treasure it up in his memory, to be proposed and discussed at the next meeting of the trustees. Let the contest be, not who shall be to keep its books and papers, and a papers. he may think would be useful in promoting the trustees. Let the contest be, not who shall suggest, or do, the least, but who shall contrive measures most conducive to the success and the fifty dollars for his services."

COMMUNICATIONS.

Jonesborough, Oct. 11, 1824.

DEAR SIR,-The excellence of its quality, and the contiguity of the Virginia plaster, to our Gen. Harper having retired from the room for section of country, renders it an object of inte-a few minutes, the chair was taken in his ab-

VOL. 6.-39.

quainted with its general properties, and applinow to be detailed. In the spring of last year, easily attainable. (1823,) I sowed with oats, four quarts of clover seed, on a part of an exhausted field, or rather OLIVER B. Re tired by twelve or fourteen successive crops of corn, the pick of which, the same year, produced less than twenty bushels of corn to the acre. When this clover seed was sowed last year, I had not plaster to roll the seed in, nor enough to plaster any but a very small part of the clover, after it was up high enough to be benefitted by plaster. The small portion of clover, over which plaster was sown, sprung up high, and much of it went to seed the first year. The ba-lance was very much inferior to the plastered part. My neighbours were called to see the dif This was the best commentary that could be made on the use of plaster, on my farm
—and they were satisfied. This year, on the first of March, 1824, one bushel of finely ground plaster to the acre was sown over one half of the last year's sowing of clover, with the exception of a small strip, purposely left unsown. On the first of April ensuing, the balance of my last year's sowing was served in the same way, with another strip purposely left unsown with the plaster.—By the 10th of June ensuing, the crop was ripe enough to cut.—Unavoidable circum-stances caused it to be delayed nearly a fortnight longer. Before cutting, my neighbours were again requested to observe the difference between the main body of the clover, sown with the plaster, and the neglected strips. Again they were satisfied.—The difference was infinite. The unplastered strips were literally unworthy of mowing,-the balance upon a satisfactory estimate of my manager was admitted to have produced at least five thousand weight of good hay to each acre. It is necessary here to remark, that upon land as much exhausted as this of mine, two bushels of plaster to the acre, would have been the better quantity-but I had it not to spare. Six quarts of clover seed, too, would have been the better quantity to have sown per acre; but my manager had never sown clover seed before, and from bad health, I was unable to sow more than just to show him how. The subject of this communication is to prove to the Society, the safety and utility of going to the expense of pro-curing plaster for clover at least. With the rea-sonable, perhaps enough for this purpose has already been said; but it may be useful to reduce the result to figures-and prove the profit, as well as the principle. During the year of my experi-ment, I paid for hay, 3s.; for corn, 2s.; and I believe those to be the general rates.

5000 wt. of hay, at 3s. per cwt. is pr. acre 1 bushel of clover seed do. \$25.00 12.00 37,00

20 bushels of corn, at 2s, is \$6.67 Add one third for fodder, &c. 2.22

8,89

Agreeably to this estimate, the difference be-icontained less than thirty families eight years cability to our climate and soil. Under this im-tween the corn and clover part of my crop, is pression, I have turned my attention early to \$28.11, for it is fair to allow, that the improvethe subject, and through you beg leave to communicate to the Agricultural Society, the result of my own experience, enquiries and observations.

The subject are the subject, and through you beg leave to commune ment of the land by clover, is equivalent to the vated five years (except at this place); and as cost of the plaster and clover seed; and no one the far greater number have opened their farms will contend, that the culture and securing an acre in the Wild Woods, in preference to the Prai-Estimating the cost of plaster when delivered of corn, is less trouble and expense than an acre on our farms-and attentively considering its of clover. I am so well satisfied of its importance comparatively inferior good effects, upon all our to my interest, that I sowed twenty additional productions except clover, I shall confine my reacres of clover, this year; on which I intend to or no attention has been paid to small grain and marks to that article alone. If clover is the onsow two bushels of the plaster to the acre, about tobacco; the chief aim has been plenty of hog ly article of produce calculated to make it really the first of March next.—I have no doubt that profitable for us to procure plaster, so I consi- plaster sown on the young clover the first year, er plaster as the only species of manure, calcula- will benefit it-but whether the profit in the end ted to make it profitable to raise clover.—Gene- will be equal to the cost, my experiments have val information, from sources upon which I can not yet satisfied me. > TH. G. WATKINS, OLIVER B. ROSS, Corresponding Sec'ry, &c.

> > Jonesborough, April 12, 1824.

To the Agricultural Society of Washington Co.

I would suggest to the consideration of the Society, the utility of appropriating a small sum to the purchase of some valuable seed, or seeds, not generally known among us, to be distributed among the practical members of the Society. The Ruta Baga and Mangel Wurtzel are plants highly recommended as affording productive crops valuable alike both for the table and stock, and are not perhaps much known among us .- Judge Emmerson, can perhaps give some information of them.-Would it not be advisable to procure a small parcel of these seeds for trial, that the farmers may without much cost, either of money or labour, test the valuable properties of the y at large ... Respectfully, O. B. ROSS. plants, and the country at large derive their advantages if any?

To the Washington Agricultural Society.

Fully aware, as I am, of the little weight any thing I can say on the subject of agricultural implements would be likely to have, I shall nevertheless, venture to suggest the propriety of adopting some measures to procure a good plough from some approved maker; such an one as might serve as a model, by which others could be made. Every one will, I have no doubt, readily admit the imperfections of the plough in common use in this country. We want such a plough introdued, as will effectually turn over blue grass and other swards, so as to prevent their injuring the crops of small grain, which may be sown on them. If a plough could be procured from the eastward, such as the best farmers there approve, and undergo a trial before a committee appointed by our Society, who were themselves practical far mers, and have, if it deserved, the recommendation of the committee; then would there be some hope of such plough being brought into extensive use amongs us. Approbation thus given would carry with it a weight that cannot be expected to arise from the introduction of the implement, by a person who is not himself, practised in the use of it.

D. A. DEADERICK.

CULTIVATED AND NATURAL PRODUC-TIONS OF MISSOURI.

Fountain Cottage, near Fort Osage, (Mis'ri) Sept. 12th, 1824.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir-You must be aware, that in this remote section of the country, agriculture is yet in a very rude spicy, surpassing as I think any grapes I have state. A tract of country comprising four counties, and not less than two thousand square miles, very juicy and may be good wine grapes-culti-

ago; and I do not believe there is one field within the whole tract, that has been regularly cultiries, you may well suppose that there are yet innumerable huge stumps and dead trees on most of even the oldest farms. Until very lately, little or no attention has been paid to small grain and tobacco; the chief aim has been plenty of hog veyed and offered for sale, and most of us have got upon our own soil, a very different spirit prevails; and I am happy to say, that there now exists, generally, a very strong disposition to introduce the culture of tobacco, all kinds of small grain, fruit trees, &c. &c.; and it is very desirable that in the offset, we should obtain the best seed that we can. It is probable that tobacco and hemp will be the staple productions of the soil of Missouri; and I am of opinion that the fine vellow tobacco, (now almost exclusively raised in Maryland) may be produced here to some advantage; and if I can procure some genuine fresh seed in time, I will try the experiment, and prevail on some of our experienced tobacco planters to try it also next season. Our fields are yet too new and fresh, to expect even tolerable crops of wheat from them-very few of them, however, have been seeded, and scarcely any of them properly prepared for wheat. An opinion seems to be gaining ground, that fall wheat will not answer here, and that we must sooner or later adopt spring wheat-I am a little apprehensive myself, that such may be the final result, but will not yet give over the hope, that when our fields are a litthe more worn and better prepared, fall crops will succeed extremely well. Meanwhile, I am desirous of trying the white flint wheat, which from the account given of it by your correspondent, appears to me to be extremely well calculated for this soil and climate, and I have no doubt will be a very valuable acquisition to our farmers; and I have not the least doubt but you will, after this explanation, send me, as requested, some of that, and the yellow tobacco seed.

I observed some time ago in the Farmer, an enquiry for a grape that ripens in July, and request-ing information of such an one if known. We have a grape of that description here; indeed, it is quite common along the shores of the Missouri-It is known by the name of slue grape, which it obtained from its being chiefly found along the banks of the narrow channels, or as they are commonly called, slues of the Missouri, behind the islands and large sand-bars. It is a small grape about the size of a large buck shot, grows in rich clusters or bunches, rather too acid for the table though pretty good for the season. It ripens from the 10th to the 20th of July generally.—The vine runs and spreads immensely, co-vering the trees with its rich foliage, and exhibits a beautiful sight when its fruit is ripe and ripen-

I have no doubt but this grape may be much improved by cultivation; with this view, I have removed about a dozen young roots (from layers) into my garden, where they are growing very luxuriantly, and will probably bear fruit summer after next. If this grape is thought desirable in your quarter, it will afford me much pleasure to send some slips and young roots to Baltimore, if the means of conveyance can be had.

This district of country abounds with wild grapes in very great variety; some as large as musket balls, others of the size of poke berries: some of them are extremely sweet and rich and .

vation will doubtless ameliorate and improve any of them. I have several kinds already transferred from the woods to my garden, and shall con-tinue to make other transfers, as I discover new and valuable varieties. It is very difficult, I find, to propagate these native vines from cuttings; I have probably tried five hundred, and have succeeded with two only; I lost much time by these attempts, and regret that I persevered so long, and neglected the mode by layers, which I now find invariably succeeds.

The great usefulness of the "American Farmer" is conspicuous in this—that it affords the medium for an interchange of the valuable productions of the most remote, and relatively, distant parts of the union. Thus we may obtain in Missouri, the seeds of such plants as are found by the experience of the farmers in New York, to be most valuable; and it may happen, that some of the valuable native productions of our Missouri forests will be translated to the gardens and vine-yards of Maryland, New York, &c. These facilities would hardly exist, but for your spirited and lities would hardly exist, but for your spirited and truly benevolent exertions, and the excellent no one asks me the prices of wool (that responding Secretary; but, as I am really in want of information, and am doomed to till a poor truly benevolent exertions, and the excellent no truly benevolent exertions, and the excellent paper you publish, the subscription cost of which is repaid an hundred fold, in my estimation, by these very facilities, independent of the great mass of valuable matter it contains.

I remain, sir, most respectfully, Your ob't servant, G. C. SIBLEY.

FOR THE AMERICAN FARMER. AGRICULTURAL CORRESPONDENCE. On the efficacy of certain Steeps, to preserve Wheat from the Fly and Smut.

TANEY Town, Frederick County, Md. 3 5th July, 1824.

MR. SKINNER,

Sir,—Some time previous to last fall seeding time, I read in a newspaper (I think it was not in the American Farmer) an account, stating with great confidence, that the eggs of the Hessian fly, were deposited in the grains of wheat, with great confidence, that the eggs of the Hessian fly, were deposited in the grains of wheat, whilst in the ear—that they could be there diswhilst in the ear—that they could be there distinguished by a microscope, &c. and that the application of quick lime to the seed wheat, would lime were omitted, I have never suffered by a microscope, &c. and that the application of quick lime to the seed wheat, would lime were omitted, I have never suffered by a gentlemen from Germany, who assured me that the practice was common there, and that it had the desired effect. The thing seemed reasonable, and I set about the work of the other instance, the crop Henry Thompson's, and Mr. Morris's cattle of the process of the seed with the company of the pens, occupied was pleased to find so many there, and that it had the desired effect. The head; while from the dry seed, about one-tenth by Mr. Caton's, Mr. Patterson's, Mr. Oliver's, Mr. brown the grain on the seed shout one-tenth by Mr. Caton's, Mr. Patterson's, Mr. Oliver's, Mr. Bratterson's, Mr. Datterson's, Mr. Bratterson's, Mr. Oliver's, Mr. Bratterson's, Mr. Datterson's, Mr. Alterson's, Mr. Alterson's, Mr. Patterson's, Mr. Alterson's, Mr. Alterso I thought it looked well, but shortly after, I perceived a change for the worse; this led to an investigation, when it appeared, that the enemy had made an attack, and was fast prevailing—in fact, not one of the 7 lots escaped, though in different fields, and I never experienced, or witness ed so much damage from the depredations of the fly. You are to observe, that in the most of those different lots, I sowed a small portion of the seed without liming, but could not discover, that in any instance they had respected my prohibinion by lime.

greatly from its ravages—and who got rid of the committee state, that no thorough bred bull, of the short horned breed was offered to their extending, tended to get a mination; that of the Devon breed, there were amination; that of the Devon breed, there were several bulls of the required age, and that the Whether the hog manure employed by Mr.

My conclusions were formed, not so much has any man found, that the large, soap making from critical and personal observation, as from sheep, on which extraordinary plaudits were bethe corroborative testimony of gentlemen of more stowed, and for which, the premium was finally practical knowledge; and their opinions appear

in cais us set us set us a set

The premium for the best heifer, was awarded for "a red and white heifer, Fancy. out of a Dun prize cow," which cow, was of Gen. Ridgley's stock of mixed short horned blood:—the premium for the second best, was given for Mr. Cook's heifer, bred in Washington County, from Mr. Sprigg's short horned stock, imported by Par-kinson. Thus the two best heifers, although so many full bred Devon heiters were upon the to effect the object; beside, the kiln was one ground, proved to be of short horned blood. The of the ordinary kind, used in burning lime with premium for the best heifer, under one year of age, was awarded to Sally, a calf five months constructed kiln for the use of coal-it may be old, by a Devon bull, out of an imported cow, built much higher than for wood, without being without a pedigree, which was the only one offered to the examination of the committee, of consequence, they had no choice.—The judges state, that for milch cows, no premium is awarded, because there were no certificates of milking—of the quantity of butter produced, and of the keep part of the kiln, will have a beneficial effect in indictable as a public nuisance. Salk, 460, and for thirty days, as required;" yet there were many full grown, imported, and native Devonshire cows exhibited by men of wealth, trustees of the Society, and active members of the committee, who not only assist in forming the bills, but generously by their purses, contribute to the funds, and by volunteer premiums decidedly prove their approbation, as well of the objects, as of the means which are taken to bring them about. How can you account for the inattention of these gentle men, in not bringing their certificates in their pockets; or not allowing their cows to bring their milk in their bags, to show their regard for the premium offered for milch cowe? - heir convic tion, that in this part of the State we must have cattle which can give milk in due proportion, however anxious we may be, to have those, which can afford labour and beef. I am now in doubt whether I shall purchase half blooded, or full blooded Devons, at the moderate prices at which they can be had; or buy short horned stock, at the extravagant prices, which they command, to enable me to take the silver cups at our next Show. I am, Sir, with great respect,

Yours, &cc. IGNORAMUS.

For the American Farmer.

BURNING LIME WITH SUSQUEHANNA COAL. Extract of a letter from a gentleman in Chester County, Pennsylvania.

"I am fully satisfied, from the result of the experiment I have made, that lime may be burn-ed with Susquehanna coal, purchased at Columbia, at the rate of \$4.50 or \$5 per ton; cheaper than with wood delivered at the kiln at \$2.50, and I do not know but on better terms than at \$2 per cord. My experiment was made in one of the new kilns, with two tons of coal to 700 bushels of lime. The method adopted was, to turn a small or low arch, and break all the ballance of the stone so small, that none should exceed the size of an half gallon jug; the kiln was then filled, by first putting heaps of coal of about one peck and an half, about twenty inches apart; then a covering of lime stone; then coal; and so on, alternately, to the top of the kiln-I then burned one and an half cords of wood, just sufficient to warm the kiln and ignite the coal, which is all the attention it requires. -You may then go to meeting, mill or market, or any other pursuit you please; the coal will make the most intense and melting heat, that it is possible to conceive. My kiln was red hot for five days, and the lime burnt to perfection, surpassing any I ever saw.

I consider the hard Susquehanna coal, as a great acquisition to our country; and, in my opinion, has lowered the value of wood land, where the object is wood, for the purpose of burning lime.

I propose making another experiment this winter, as it is evident that I used much more coal in the first experiment than was necessary wood. Much fuel may be saved by a proper subject to the same inconvenience that wood kilns are, from that cause; as the fuel will be its ascent.

When my second experiment is made, I will shall not go unringed in the woods. report the result."

LAW OF TRESPASS IN MARYLAND-SHEEP, Dogs, &c.

TO THE EDITOR OF THE AMERICAN FARMER. Annapolis, Nov. 24, 1824.

Dear Sir,-When your's reached this, I was attending Montgomery County Court, where my professional engagements necessarily detained have found a very sick family, which, with an accumulation of business during my absence, required immediate attention. These concurring circumstances prevented my attending earlier to now, by stealth.

The case of Lloyd and Tilghman, mentioned in the American Farmer, vol. 5, No. 33, fol. 264, would be found, if examined, to be only declaratory of the common law relating to cattle damage feasant, and which I will endeavour to explain and illustrate, concisely, and yet as fully, as my time will permit.

Damage feasant, is when the beasts of another, no way privy to the estate, are found in a man's close, without the leave of the owner of the land, and without the fault of the possessor of the close, (which may happen from his not repairing his fences) and their doing damage, which may be by feeding, or trampling, or otherwise, to the Agriculture and Internal Improvements in Penn-

grass, corn, young timber, woods, &c.

If the beasts (which is the law phrase) are damage feasant, the person whom they damage, may distrain and impound them, as well by night

the cattle being there, damage feasant. al messages, the parage. If the party injured, does not wish to impound, lative to these topicks. he may resort to his action of trespass.

pound, but there may be open and close pounds. dual, and the power of the nation. An open pound (not common but private) is any secure, uncovered place, in which the cattle are nia, to the Legislature now in session, the follow-placed. A close pound is, for instance, a part ing are the passages which treat of Internal Imof the distrainer's house, stable, &c. and he is provement and of Agriculture. bound to feed them in either.

have done it by immemorial custom. It is the have been diligently engaged in the performance duty of the steward in the sect to attend to this, of those duties, a detailed statement of which will before whom any default is punishable.

Hogs running at large, has been a complaint in this state for many years. No legislative provision has been made, and it is a very difficult subject to legislate on. The population of our country is very sparse, the plantations and farms large, the lines of division fences very long, and above all, the labouring part composed of slaves, who are constitutionally indolent, and whose interest is at variance with the master's. It being the interest of the master to obtain industrious labour, and of the slave, to perform no more than will screen him from chastisement. In consequence of this, there is a constant hurry on the irm, and the fences are miserably neglected.

The legislative provisions respecting hogs, are by the Statute 35, Hen. 8. Ch. 17, Sec. 17, swine

In most farms, the owners, with proper atten-tion, may keep the division fences in order. I have no doubt, that if A. and B. have two adjoining farms, and if A. give notice to B. to repair, and he will not in a reasonable time, that A. may repair and recover from B. the value of the labour and materials found, provided the fence has not been foolishly expensive. One decision of this kind, would have a good tendency, as it would make the law known to the community.

professional engagements necessarily detained me for nearly a fortnight, and on my return, tected from dogs. The law upon this subject is very simple. The owner of a dog is bound to muzzle him, if mischievous, but not otherwise and if a man doth keep a dog that useth to bite cattle, &c. if, after notice given to him of it, or your request. In truth, I may be said to do it his knowing the dog to be mischievous, the creature shall do any hurt, the master shall answer for it. Cro. Car. 254, 487. Stra. 1264. It is indictable at common law, to keep a dog unmuzis unknown to me. It has not been reported, and zled near a highway, accustomed to bite, when I expect contains no new principle of law, but the owner knows of the mischievous propensity of his dog. Crown. Cir. Com. 311, 2 Chitty's Crim. Law, English edition, 643 American edition by Richard Peters, Jr., 410.

I would go farther, and make the owner of a dog that had attacked sheep, after notice, or knowledge, punishable by fine, to be recovered by indictment. JAMES BOYLE.

AGRICULTURE AND

Internal Improvements.

sylvania.

As the Governors of the several states may be supposed to represent, as nearly as may be, the state of Agriculture and Internal Improvements, as by day; and he may keep them in the pound, and the public sentiment and capabilities of the until satisfied of the damages, and the law pre-sumes the owner of the cattle, always to know of shall from time to time extract from their annual messages, the paragraphs and expositions re-

They will at least give us a birds-eye view, It may be necessary here, to define the meaning of a pound. Pounds are of three kinds—common, open and close. In this state there is no common concern the wealth and comfort of every indivi-

In the message of the Governor of Pennsylva-

"The commissioners appointed under the act of In England, a common pound belongs to the the last session, providing for the appointment of township, lordship, or village; and in every a Board of Commissioners for the purpose of proparish ought to be kept in repair by those who moting the internal improvement of the state, be presented to you, during your session. The

[·] Columbia is about 30 miles from the kiln in which the experiment was made.

session may be considered as the continuation of a system, destined at no distant day, to mingle the waters of the west, with the Atlantic-Wheneance may be securely placed upon the intelligence and patriotism of our citizens. From the in-formation we have already obtained, there is but est and best route, for the connexion of the western waters with the Atlantic, in which event, we rock—then a deep blue rock mixed with claymay confidently expect the aid of the general gowide extended, and extending confederacy.

lower section, and forty-two locks, on the upper without touching a new vein of water, a thing new well must be commenced—\$2,50 seems at section of the River Schuylkill, and whether the that has not yet occurred to us; we generally get first sight to be a great sum; but it dwindles to manship like manner. The warm terms of praise, vance. in which the Commissioners speak of this work, is highly gratifying, and whilst its completion is evidence of the individual enterprise of our citizens, it shows that Pennsylvania has not been inattentive to this essential branch of internal im-

tiful and thriving metropolis.

"In the distribution of power under our compliplicated system, commerce and manufactures seem to have been placed more immediately un-der the superintendance of the general Government; whilst the interests of agriculture have been left in a great measure to the protection of the respective State Legislatures. Hence it results, that these important interests demand our of pressure and difficulty for the farmer, it is necessary for him to make up in quantity, for the depressed price of his agricultural products .-Experience has demonstrated the great advanta ges of Agricultural Societies, and it is besieved that a further extension of the system, by the establishment of a State Institution, with a small annual appropriation, would greatly assist the labours of that valuable portion of our citizens."

Speaking of the importance of promoting education, Mr. Schultze pays the following just com-pliment to General T. J. Rogers' Biographical

Dictionary.

"Connected with education, permit me to call your attention to the American Biographical Dictionary, compiled by one of our citizens, and intended for the use of schools. This work, which is well executed, illustrates the principles of our Government, and holds up for imitation to the rising generation, some of the highest examples in the page of history, of heroism and devotion to country. As an incentive to virtue, and love of country, it may be well worthy of Legislative patronage."

Domestic Economy.

BORING FOR WATER.

November 18th, 1824.

"Dear Sir-I will answer your questions respecting boring, in the order in which you ask ver the necessary information has been collected, them. I hope that I may make myself intelligi-and the practicability of canals, in the western ble—I am always ready to explain. First, dehth. and the practicability of canals, in the western ble—I am always ready to explain. First, depth. section of our state, fully as ertained, it will be This depends on the nature of the substance the part of a well regulated and wise policy, to through which the chissel goes. In some cases, I extend with a liberal hand, the fostering aid of have no doubt but that water could be obtained the Government. The resources of the state, at the depth of 30 or 40 feet; I mean a perpetuare fully equal to the enterprise, and every religious tream that shall discharge itself voluntarily. al stream that shall discharge itself voluntarily.

As it respects my well, we had first to go through soft red shell—then hard red shell—then granite-then a blue rock mixed with calcareous little doubt, that Pennsylvania presents the cheap- earth-then a blue hard rock with a sharp gritthen a rock as hard as adamant-then a grey soft then a hard black rock-then a light blue rockvernment in this national work, so incalculable then the original hard red shell-am now at the in its advantages to the different states of our distance of 145 feet-we are boring on a hard ide extended, and extending confederacy. dark brown rock. The water is this day within "I have the pleasure to transmit herewith, to five feet of the surface. We expect to get you the report of the Commissioners, appointed enough for our purpose in the course of a week, to view and examine, twenty-two locks, of the perhaps to-morrow, as we have bored 12 feet navigation is so far executed in a masterly, work- a foot or two of water in every 4 or 5 feet ad-

It will be inferred from what I have said, that a deep well. In order to obtain a supply, the the chissel will advance according to the resis-rocks must often be blown—lives are very often tance it meets with. to loadstone. The poles were so powerfully im-pregnated with this extraordinary mineral, that most serious and anxious care; for at this time they would suspend a heavy pruning knife; and all water works will be abandoned, and water will our penknives, by merely touching the poles, be procured in this way. It will cost less to behave abstracted so much of the effluvia, as that they can attach large needles. The particles of pense of the old water works. One of these rock at all times brought up, are incalculably small. When we were in the loadstone rock, I examined the particles. By merely holding the of the subject. edge of a knife over them they flew; that is, the magnetic particles flew and hung suspended from vicinity. I infer from this question, that you are tion, but it disappeared after going a few feet deeper, and although the poles still impart the power to steel, there are no more of the loadstone particles in the well.

Third-As to the quality of the water thus obtained. When Mr. Disbrow had bored to the depth of 135 feet in the first well that he attempted, he obtained delicious soft water, which dis charged about two gallons a minute. But this was not thought sufficient for a distillery, and al. pound to his readers.] though the water run over the hole very freely, they continued to go deeper. It is now 175 feet a particular place?-Has drought ever diminishdeep, and the water is very good, but not soft ed them, and destroyed them? In such springs is enough for washing. It discharges four gallons the hulse, or short ebb and flow visible .- Have a minute, and is so cold in summer, that ice would they been analysed, if so, what minerals do they be superfluous.

importance of a water communication in a politi-cal, conmercial, and agricultural point of view, is now so well understood that it may be deemed unnecessary to advert to it. The Act of the last grounds, to derive advantage from this resource.] like a flute, with a thin band of iron over the joints. These are to be put on as the joints are lowered in the well, which is 24 inches diameter.

Fifth-What time does boring occupy. This I have answered in the first page-It varies from 10 feet to 2 inches, according to the quality of the rock.

Sixth—What fixtures are necessary when the well is finished. Nothing is wanted but a pent stock or hydrant stock, with a stop cock. This stock must be grafted on the tube, about 3 feet below the surface, and then steadied by means of clay, well pounded around. You need not shelter it as the temperature of the water is not affected by atmospherical influence. I shall build an arbour over mine, and cover it with sweet-briars-cattle will not meddle with sweet-briarsmine is in the farm-yard near to my stables.

Seventh-Expense. I give two dollars and a half a foot, and am at no risk. If the borer fail in getting water at a depth agreed upon, (I have given him 200 feet for a trial) I pay him nothing. There are no other casualties for the borer than the loss of a tool or chissel in the well. If it cannot nothing when you take all the blessed effects into consideration; besides, one is often obliged to Second—The length of time to complete a well. give even three and four dollars a foot for digging, and we have bored 3 feet to-day in a hard red impure it often is. Every calculation is in favour of this new mode of obtaining water—new, how-When we were about 110 feet deep, we came ever, only in America. Can any one fail in esti-

the edge, and in looking through a magnifier, they trying to form an opinion as to the probable source appeared to be of the form of shrubs and trees. I forget at this moment, whether we discovered the loadstone before or after the adamantine rock; my farm, the opinion that the water came from a lighter think after we got the country in the loadstone before or after the adamantine rock; I rather think after we got through it; at first we higher source than our level, was so fixed in my thought the phenomena proceeded from fric-mind, that it did not admit of dispute. As the work advanced, the subject occupied much of my thoughts-new circumstances occurred-appearances altered-I began to wave my opinion-I applied myself to such data as were within my reach-and, I am now as fully impressed with the belief that the water does not come from a higher source, as I was before to the contrary.

[On perusal of the above, the following questions occur, which the Editor begs leave to pro-

How long have springs been known to exist in pass over? Rather, we beg that the pulse, or ebb [The following is the reply of a person who we knew had employed Mr. Disbrow to bore for wa- to a certain depth, that the soakings of noxious the same manner as the human pulse is counted. To do this properly, a trough of about 6 or 7 will have fine peaches; if your trees are very feet should be placed close by the spring, and so small and young, I would not recommend the ley near the apperture, as that the water should be to be poured on them very hot, for fear of injuring on a line with the trough, otherwise if the water the trees; but if the trees are of any size, it will fall from even an inch height, the attraction of gra- not hurt them; for I have used it many years vitation will overcome the impulse, which is very feeble. The attention of our observing paries.]

Horticulture.

FOR THE AMERICAN FARMER.

TO ALL LOVERS OF FINE PEACHES.

It is common in this country, especially where the soil is very good and rich, for the peach trees to be much injured by an insect commonly called fine. Where you have it in your power, thin slugs or wood worm. This insect is deposited in them when small as a nut-meg, and in common, the bark of the tree near the ground, sometimes higher than a foot, but commonly within a few inches of the earth, by a small fly; and the first appearance of it is a stuff much like saw dust, will run out of their holes with the gum of the tree, and in a few days will get between the bark and the wood of the tree, and if not stopped or destroyed, will not only injure the fruit, but some times destroy the tree altogether. In summer, after a rain, when they have their growth, they will run out with the gum and be connected in it until they form a thin shell round them, and come out another fly; when they come out they are about 3-4 of an inch long, with red or brown heads; while they are preying on the tree, they work higher up or lower down, according to the weather; in cold weather they go down to the roots from the frost, and in moderate weather they work higher up the trunk of the tree; and, when they eat quite round the tree, the tree will die ciety and leave a lump of gum round the trunk on the ground, which will appear to be mixt with saw dust or something like it. If the soil is rich from the ground soon becomes rough, and there are its smoothness much longer, and there will be no harbour for those vermin, and the trees appear to bear better than in rich soil, and that is the cause why many gentlemen say, poor, sandy soil, suits peaches best; but the fact is, rich, light, or even a little stiff soil, will bring finer peaches than poor, if proper attention is paid to those insects and the muck-worm—the muckworm is an insect more under the roots. I have tried a great number of experiments to destroy those insects, and beg leave to mention a few of canal round the trunk of the trees, say 3 inches broad and several inches deep, until you can see the top of the roots; then, if the insect is in it, pour hot ley 18 or 20 inches from the ground on the trunk of the tree, and let it run in the little canal, which will destroy all the insects that are young and not yet quite through the bark, and is a good manure for peach trees; and let the canal as the track will in winter get full of water, snow and ice, and the insects cannot in so short a time get down so far but the frost will destroy them.

If pigs could be penned often in the peach orof the trees round with straw-sedge, &c. during summer, you will find the fly cannot get to the of freight or transportation. bark to deposite its eggs, and by that means, you

with great success, for it is sure to destroy all that is not through the bark, and concealed between trons is earnestly requested to the above inqui-the bark and wood. Some gentlemen use tar ries.] on thin or mixt with grease; ashes and soot are also good for peach trees, and flower of sulphur; and do not let your trees hold too much fruit on them, as by being over loaded with fruit, the can husbandmen, trees are often injured, and the fruit not half so 1-10th is enough to leave on the tree of what it would sometimes hold by being left to nature. JOHN WILLIS

Oxford, Nov. 30, 1824.

> >ne DISEASES OF DOMESTIC ANIMALS AND THEIR CURE.

Spavin .- A disease of the horse's hock, which enerally causes lameness. Spavins are of two kinds, the bone, and the bog or blood spavin. The former consists of a bony enlargement of the inside of the hock-joint, towards the lower part; the latter of a soft but elastic tumour, a little higher and more on the inside, or towards the bend of the joint. The most effectual remedy for bone spavin is firing, and if it be done at an early period of the disease, it often cures it. In Answers to Inquiries on Millet, and obstinate cases, I have known the bony swelling punctured in several places, and some blistering ointment mixed with a small proportion of corroon Mangel Wurtzel. sive sublimate rubbed in. This produces a high on Reclaimed Marsh and its Crops. degree of inflammation, and is sure to leave a permanent blemish; but, in some instances, has effected a cure. THE FARMER.

BALTIMORE, FRIDAY, DECEMBER 17, 1824.

Accessity and importance of a Room and Libra-ry, for the Maryland Agricultural Society.

Amongst other resolutions passed at the last meeting of the Agricultural Society, there was one, instructing the Trustees, if they should deem it expedient, to rent a room as a place of meeting, and for the use of the Maryland Agri-

cultural Society.

The society has now taken such root, as to insure, with good management, its vigorous growth and continued existence—Its prospects and its means are such, as to justify and call for, some permament arrangements, of the character contemplated in the above resolution-In truth, who ever before heard of a society, without some fixed place of meeting? and who does not see the utility of having some common, established place of resort, where those who have agreed to associate for the common benefit of their profession, may come together at stated times, and talk over their affairs, and devise measures to enlighten themselves as to their true interests, and to have those interests rightfully protected by the publick authorities?

Furthermore, the Society at their Agricultural Room, should have an Agricultural Library-This might be commenced by the voluntary do nations of persons liberally disposed to further the views of the association; and when the funds of the society will justify it, a small appropriation might be made, to be expended in annual additions of books on agriculture, botany, and their kindred sciences; to this library the members should have free access. For example, a farmer wishes to build a barn, a cart, or a plough, he would have only to go to the society's room, and there he would find books containing drawings of these objects in every form, with explanations of the true principles of their construction. Sup-pose he wants to know all about the use of lime as a manure; he has only to go and turn to some agricultural work where the subject is fully treated, and he learns its chemical properties, and the best state and mode of applying it to agricultural purposes; in short, such an establishment would encourage a habit of reading, and of enquiry, that could not fail in improving the minds, as well as the practices, of agricultural gentlemen. It seems to grow up naturally, as one of the most valuable fruits of the seed we have been sowing for the last five years. As a proof of the opinion he en-tertains of the utility that would result from the adoption of the resolution above mentioned, we know an individual who would at once contribute for the use of the society, books which have cost 4 or \$500. But the advantage which seems to be indispensable, is the provision of a place where the society may hold stated meetings, once in every month, or at least quarter yearly. To shew the necessity of such meetings, let us review the proceedings of the society on Saturday last; not one of the several important propositions adopted in reference to applications to the legislature for pecuniary aid, for alterations in our act of in-corporation, for the enactment of laws more ef-first volume of "LAWRENCE ON THE HORSE."

at least one month before the session of the le- less search after them. gislature; instead, whereof, the society met in a hurry at a tavern, and adjourned in a hurry to meet again, they know not when, or where .- It is granted, that every thing cannot be done in a day; there must be a beginning to all things; we must crawl before we can walk, and

"Vessels large, may venture more, "But little boats, should keep near shore."

Dame Prudence always stands ready, with good batch of those truisms, to stop the mouth of enterprise, and check the progress of improvement—but let her ladyship remember another saying of Poor Richard, that "Industry need not wish-and he that lives upon hope, will die fasting." Our society has been five years now in comparatively active, and growing existence; and if it cannot venture now to provide a decent room to meet in, and the nucleus of a library, by the use of which, the young farmers who are coming on, may learn the morals, the politics, the statistics, &c. of their profession-whereby, in a word, they may learn not only what is to be done, but the why and the wherefore, it should be done. Why then, indeed, have we been toiling, as we humbly think, to little purpose. If we understand the true, and the higher objects of the "Maryland Agricultural Society," it aims, not only to augment the of that honourable and virtuous class of citizens, en to the public. The author is Captain Medwin, who make their living by tilling the soil.

P. S. In a room provided as above suggested, any gentleman might deposite specimens of grassor plants, or soils, or substances, to be handed over to, and examined, and analysed by, the professor of Botany, or Agricultural Chemistry, as the case might require. From this room, valuable and remarkable seeds, fruits, grains, &c. might be distributed amongst the membersmonthly reports might be made, for publication in the American Farmer, of the state of the crops in the different counties. The Farmer would here learn what he ought to expect for his produce, as well as the current prices of it-in short, it would be a sort of Farmer's Exchangesuch, at least, are our impressions, crudely ex-

pressed, yet we hope intelligible.

The members of the Board of Trustees of the Maryland Agricultural Society, are hereby notified that the next meeting will be held at the residence of Gen. R. G. Harper, on Monday next the 20th inst. at eleven, A. M.

Important propositions will be under consideration, and it is desirable that the meeting should be full and punctual.

The Editor will be indebted to any Gentleman who will send him about a tea cup full of Tobacco seed, of what is usually called Maryland yellow.—The object is to divide it amongst gentlemen who have written for it, and who are always ready to reciprocate civilities of this kind.

The Editor is much indebted to Mr. Leonard Matthews for seed of the genuine high flavoured smoking tobacco of Cuba-and will give about a dessert spoonful to any planter who may desire it .- The tobacco retains its high flavour for two successive years in this country.

fectually to the farming interest: there is not one the Editor will thank gentlemen who have his of these, which ought not to have been discussed, books, to grant him the loan of them long enough

Printed every Friday at 84 per annum, for JOHN S. SKINNER, Editor, by JOSEPH ROBINSON, on the North West corner of Market and Belvidere streets, Baltimore; where every description of Book and Joh Printing executed with nearness and despatch— Orders from a distance for PRINTING or BINDING, with pro-per directions promptly attended to, addressed to J. Robinson, Bal-timore.

AGRICULTURE.

The following are the documents which accomthe Premium of a Silver Tankard, valued at fifty dollars, was awarded to Col. N. M. Bosley, and presented by the hands of General LAFAY-ETTE at the late Cattle Show. It will be recollected, that at the instance of Col. Bosley, the committee also made to his farm a visit of personal inspection.]-ED. AM. FARM.

Questions proposed by the Committee acting as Judges, on the best cultivated Farm, in the case of Col. A ICHOLAS M. BOSLET :-

1st. How long have you had this farm in pos-session—and under cultivation?

Answer. I have had the farm in possession since 1811-and in cultivation since 1812.

2d. In what state was the farm when you took

it in possession?

he

yl-

ok,

rial

ER,

Answer. It was in a neglected state, almost uninclosed—the briers and brambles gave striking evidence that the former cultivators had very much neglected their interest. A great part of about thirty in wood land. the land is naturally hilly, and was much broken: it was marked by deep ravines and thickets of briers. For the better guidance of the Judges, I submit the statements of some of my neighbours, to whom the situation of the farm when I first occupied it was known.

3d. What course did you adopt in the first instance for the improvement of the soil?

Answer. My first object was to clear the land of the filth by a course of cropping, followed by clover and plaster.

4th. What manures did you find the most effectual-and in what manner were they employed?

Answer. When I first took up the farm in its impoverished state, I employed every particle of stable manure, compost, and occasionally penning tility; having been compelled to buy hay, it was an object of great importance that I should set immediately some portion of my land in grass .per acre on clear ground, such as corn ground; but I did not find the effect answer expectations; I afterwards tried it on a sod turned down, applying the lime on the surface after being harrowed, and then harrowed the lime in. This was generally followed by a corn crop in which I discovered good effects, even on the crop of corn; after taking off my corn crop and stalks, which I generally have hauled to my barn yard, I have it expedient they can make use of the above. ploughed up in the spring and occasionally stirred during the summer, which has also the advantage of clearing the land of all filth, and at the same time incorporating the lime with the soil. I sowed it in wheat, with clover, and timothy; but afterwards I found on an application of one hundred bushels to the acre, the effects were much greater, and it has since been my constant habit to apspring in the weakest portions of my corn ground of the year previous, when it is in a state of fermentation, and have invariably found its application in that state more beneficial than any other. The corn stalks, after being trampled by cattle

5th. What depth do you plough your land? Answer. From six to eight inches

6th. What is the quantity of products from your soil—and of what particular kind?

VOL. 6.-40.

7th. What number of hands do you employ?

Answer. Generally seven.

8th. What number of horses and oxen do you

Answer. Ten working oxen and nine horses. 9th. What is your stock of hogs, sheepyour views of the different kinds of stock?

Answer. Forty-two sheep-thirty-four fatting hogs, supposed to average from 180 to 200 lbs. each, about eighteen months old-four breeding sows; thirty four pigs and shoats; thirty two head of horned cattle, including working oxen. So far as this question refers to stock, I must decline an ninety cocks of hay, made on Col. Bosley's farm, that deliberation which I would wish before I age cock, after it was well cured, fit for the stack, formed an opinion.

farm?

Answer. About four-hundred and sixty acres seventy of which I have recently purchased-

NICHOLAS M. BOSLEY.

Locast Grove, Nov. 15th, 1824. at such times as those when industry, frugality, and economy, combined with agricultural imbourhood, I am induced to give the following:-

I certify, that to the best of my recollection, Colonel Nicholas M. Bosley settled on the place In eighteen hundred and seventeen he sold the he now lives on, known at this time by the name products of eighteen hundred and sixteen, for my cattle up for the purpose of bringing immediately some portion of my land to a state of ferbriers; the fields full of gullies; the whole farm remarkably stony; the fences so much out of repair, they might comparatively be called none I afterwards applied lime at the rate of 50 bushels per acre on clear ground, such as corn ground; such has been his industry in reclaiming the soil, that when he came on it, it would not yield more than five barrels of corn per acre, or ten or twelve bushels of wheat, when at this time it will turn off from ten to twelve barrels of corn, and from twenty to thirty bushels of wheat to the acre:his fences at this time are rather superior to any

ABRAHAM H. PRICE.

Baltimore, 16th Nov. 1824. To the Committee for the inspection of Farms on the Western Shore of Maryland.

Gentlemen,-I resided in the neighbourhood of Col. Bosley's farm at the time he took possession of it, some time in the year 1811. It was at that ply that quantity. My long manure from the time, I think I may safely say, waste, and not culbarn yard and stables, I generally put out in the tivated. The fences good for nothing; the fields sedgy, stony, and washed in large gullies. A considerable part of what was Nailer's farm, had donationbeen for a long time abandoned by Nailer as use. less and not worth cultivation, I mean particularly that very high hill which now looks so flourishduring the winter, and laying in the barn yard ing and fertile. There were no buildings on the field,

15 during the ensuing summer, I haul to my wheat farm worth any thing, and they have all been long since removed as nuisances, except one small members, agreeable to the 7th article of the residual control of the re long since removed as nuisances, except one small log hut. The fences are now excellent, I believe the best in the neighbourhood; and what still For this premium, which the committee conmore strongly shews Col. Bosley's great exertion sider as the most important of any on the Socie-

hundred and sixty bushels of wheat—twelve hun-miles. It would be impossible for me to recollect dred bushels of rye—three hundred bushels of and enumerate the particular facts which ought THE PREMIUM FARM.

Outs—about two hundred and ninety tons of hay to come under the notice of the committee; but I think I can confidently say, that I have never panied the report of the committee, by whom dred and forty-five tons fit for market. and with the same limited means, on any farm.— When I speak of limited means, I refer to money; Col. Bosley's vigorous exertion, and patient industry, enabled him to accomplish great objects of improvement with little expenditure of money. And in his case I think the expenditure of money, for the great objects obtained, is smaller than in any other case I have ever known.

I remain, respectfully, your's,

ALEX. NISBET.

I certify, that I counted nineteen hundred and answer, as I have not given the subject of stock, of timothy and clover; and I weighed an averwhich weighed three hundred and twenty-five 10th. How many acres of land have you in your pounds; sixty loads of rye, which averaged twenty bushels per load; and two hundred and sixty bushels of wheat; and three hundred bushels of oats; all of which I measured. There is about three hundred barrels of corn-and there has been about three hundred loads of manure hauled out-four oxen in a cart.

BENJAMIN AMOS.

There have been seeded at Hayfields, the last fall, upwards of two hundred bushels of wheat.

[By another document it appears, that while provements, (or in other words improving our Col. Bosley has been carrying on the usual ope-farms,) are indispensably necessary for the good rations of farming, at Hayfields, he has had to enof the community in general: and hoping it will counter the extraordinary expense and labour of cause a spirit of emulation in Farmers collective-supplying himself with chesnut rails to the numly in the different States, as well as in this neighber of 60,300; whereof 55,000 have been hauled bourhood, I am induced to give the following:— eight miles, and the remainder from a distance of three miles.

of Hayfields, about the year 1811; at which time \$6,502 27; of which \$2,378 4 was the proceeds of the hay crop.]-ED. AM. FARM.

BERKSHIRE AGRICULTURAL SOCIETY.

[The Proceedings of a great number of Agricultural Societies are sent to us, from all parts -It is impossible to insert so many details-The Agricultural Addresses too, are so numerous, and generally so long, that we might fill half of every number of the Farmer with them. Of these addresses and proceedings, we shall endeavor to select such parts as are most practi-cal and of most general bearing.—Amongst the best of the many addresses on hand, are those of Mr. BARTON, Vice President of the Agricultural Society of the Valley, in Virginia, and the one delivered by Mr. WORTH, at the last meeting of the Pennsylvania Agricultural Society. Of the proceedings of the Berkshire Agricultural Society, forwarded for publication, we are compelled to omit all but that which follows. Our own Board of Trustees may take some hints from what is said about the appropriation of premiums for certain designated objects]-E.D. AM. FARM.

Best Managed Farm-the residue of a special

By Laws.

il—and of what particular kind?

and industry, the rails, with the exception of a ty's list, and which, they confidently hope, will handwer. Three hundred barrels of corn—two very small part, were hauled a distance of eight never be abandoned, because it embraces within

gladly go into considerable detail in relation to each farm, were they not forbidden, by the ne-cessarily circumscribed limits of a report. The committee cannot, however, refrain from remark. ing, in regard to that of the venerable Judge Walker, that he has successfully introduced the system of rotation, judicious management, and regularity of accounts, which he so earnestly re-commended in his address to the Society, when President, in 1819.

The committee are fully aware that their decision will probably disappoint many. They trust, however, with confidence, their endeavors to do impartial justice will be appreciated, even by those who may deem them unsuccessful; to such, as well as all others who may not obtain the honor of a prize, they beg leave to remark, that it is
impossible all should obtain rewards; that their
may be most efficaciously applied—and, if the
ject of special care and analysis with the accomturn for premiums may come another year; and that all the improvements they make in this honorable strife, will either give them immediate profits, or add to the value of their farms. Besides the committee indulge the hope, that a higher and nobler wish than that of being the success ful competitors, had an influence in inducing them to offer to view the results of their industry and skill in the parent art; the art, which of all encouraged; because, directly or indirectly, every either summer pasture, or winter fodder; whilst science.

member of the community owes to it, all his enjoyments, all his wealth. "The true objects of the Agriculturist," (as is very justly remarked to the use of Lime, and its effects have been scarce by the celebrated Davy) "are likewise those of the use of Lime, and its effects have been scarce fair estimate, if we treat of it ing heads.]—Ed. Am. Farm. the patriot; men value most, what they have plied."
gained with effort; a just confidence in their own Four powers results from success; they love their country better, because they have seen it improved by their own talents and industry; and they identify with their interests, the existence of those institutions, which have afforded them security, independence, and the multipled enjoyments of civilized life."

The committee have availed themselves of the opportunity afforded, not only to remark on the general state of agriculture, but to profit of oc-casions to elicit valuable information from the many enlightened farmers whom they have met during their several tours; and deeming it in-cumbent on them to communicate to the Society, whatever, in their opinion, may tend to the promotion of its views, or the extension of its use-fulness, have judged it advisable to make it the subject of a separate report, which is hereunto annexed, marked B. Per order, THOMAS MELVILL, Jr. Chairman.

AGRICULTURAL REPORT .- [B]

The Viewing Committee of the Berkshire Agricultural Society, considering the duties devolving on them, as not circumscribed to the views of crops offered for premium, but as extending to whatever may, in their opinion, have a tendency to the promotion of its object, and the expansion of its usefulness, beg leave to offer a few brief

remarks, with a view to this important subject.

And, firstly, in relation to Fruit Trees. It is evident our old Orchards are rapidly decaying, while it is equally so, that for the most part those lately set out are left to their fate. As well might we expect a young child would thrive and flour-ish, in defiance of want of nourishment, and the assaults of disease, without care, assistance, and protection, as that a young tree should work out its own salvation, without any exertions of our a perfect conviction of its practical tendency and . Elements of Agricultural Chemistry, ft. 224.

itself "good management in every department of lown. The committee are of opinion, that pre-effective value to our readers. The interruption

instituting premiums on this subject.

Thirdly, on Lime. In a district of country

the expense.

The committee are induced to urge the subject on the attention of the Society, not only from a President of the Pennsylvania Agricultural Soci-

Fourthly, on naked fallows. On some soils, and under some circumstances, they are undoubtedly is found native at Shotover Hill, Oxfordshire; necessary: whilst on others, they cause not only and abounds in many other parts of England. the loss of one crop, but a needless expense of Natural gypsum commonly consists of water, sullabour. Judicious rotations, adequate manuring, phuric acid and lime; 22 parts of water, 46 of the culture of corn, peas, and rape, (the former, sulphuric acid, and 32 of lime. When the water of an early kind, to be cut up when seared, and is expelled by heat, the other constituents keep removed from the land to ripen and cure in stacks their proportion unaltered. As a manure, it is —and the latter, to be fed to sheep)—or, the the subject of much difference of opinion. It ploughing in of green crops, it is believed, would may unravel some perplexities, and conduce to be more advantageous, than the present general a fair estimate, if we treat of it under the four practice.

Fifthly, on Winter Meelin. Experience having demonstrated that this crop is subject to less casualties than either species of grain, when sown and while its elements remain fixed, it neither separate, the committee would recommend, that assists the putrefaction of animal remains, nor it be introduced into the list of premiums.

consequently, the study and practice of the true principles of agriculture were neglected, until necessity awakened us to the need of a reform.

To this cause we are principally indebted for the numberless patriotic societies spread abroad through every section of our happy country, for the purpose of collecting and diffusing agricultu-ral information. And it is gratifying (especially to those who afforded them countenance and support in their infancy) to perceive that the object is pursued with a zeal and intelligence, which characterizes the efforts of a self-governed people, whatever may be the objects to which they are directed.

THOMAS MELVILLE, Jr., Chairman. Pittefield, Oct. 5th, 1824.

TREATISE ON SOILS AND MANURES. [We resume this subject with pleasure, under

husbandry," there were but three farms entered; miums on moderate sized orchards, to consist not on each of which, the committee found so much only of the apple, but of hears, hlums, and cherto approve, so much neatness and economy, connected with such admirable system, and praise worthy industry and perseverance, that they would be inconvenient, only of the apple, but of hears, hlums, and cherties, would produce a salutary effect.

Secondly, on Manures. No branch of our husbandry is, perhaps more generally defective, than without any diminution of effect. For instance, that which regards the careful preservation, and the last extract, given in number 33, related to judicious application of manures; and in no way the application of lime as a manure; we come can we improve our farms so rapidly and profitably, as by adopting the practice and experience of those who have scientifically and successfully or Sulphate of Lime. It is found in Oxfordshire, investigated the subject of the best received. investigated the subject, as to the best means of and many parts of England and America. The making, increasing, and preserving—and the best writers of that country tell us that it is composed manner of applying them, to various soils. The of water, salphuric acid and lime; 22 of water, primary object being to increase the quantity, the 46 of salphuric acid, and 32 of lime. When the committee beg leave to suggest the propriety of water is expelled by heat, we are told, that the other constituents keep their proportion unaltered. As a manure, on the question of its modus abounding in Limestone, as is the case in Berk operandi, or to speak more plainly, its mode of shire, it would seem interesting to fermanent operation, there is much difference of opinion.—
improvement in husbandry, to institute an inquiry, We regard it as a matter worthy the investigation benefits resulting from its application will warrant plished Professor of Chemistry in our University, Dr. De Butts; but it is not probable, judging from the past, that he will ever have, at the same moment, leisure and inclination to favour the plodconviction, in their own minds, of its importance, ding practical farmer with the profound deduction to having been recently stations of his closet researches. Happily for our ed in an address of the Hon. Jonathan Roberts, Society, its present Professor, Dr. J. T. Ducatel, will answer to all reasonable calls on his time, and ety-"that soils to which Gypsum has been appli- talents, which have a tendency to promote the others, deserves to be the most venerated and ed for several successive years, cease to afford cause of practical agriculture and of general

In regard to Gypsum, our author tells us that it may unravel some perplexities, and conduce to a fair estimate, if we treat of it under the follow-

following heads: the decomposition of manure. The ashes of par-Whilst we had an abundance of fresh and ticular sorts of peat contain a considerable quanfertile soil, it was the interest of the farmer to
tity of gypsum; some kinds, a third part; and
spread his labor over as great a surface as possible; such ashes have been applied with good effect as a top dressing for cultivated grasses. In correspondence with this, the ashes of sanfoin, clover, and rye-grass, afford considerable proportions of gypsum: but only a very minute quantity of it is found in barley, wheat and the turnip. The reason why the artificial mixture of gypsum with soils is not generally efficacious, is probably, because most cultivated soils contain sufficient quantities of it for the use of the grasses, and an excess of it above what other crops absorb in their growth. Gypsum is contained in stable dung, and in the dung of all cattle fed on grass; and it is not taken up in corn crops, or crops of pulse, and in very small quantities in turnip crops.

It is possible that lands which have ceased to

bear good crops of cultivated grass, may be re-stored by a dressing of gypsum. As to the ge-neral standard for the application of gypsum,

those plants seem most benefitted by its applica-cocted into pulp, may be thrown out unchanged tion which always afford it on analysis; such as they may alter the flavour without entering into lucerne, clover, and most of the artificial grasses: the essence of the fruit. But where the soil already contains a sufficient quantity of this substance for the use of the grasses, its application even on pasture cannot be advantageous: for plants require only a determinate quantity of manure; an excess may be detrimen-

tal, and cannot be useful.

It has lately been asserted, on the authority of a gentleman resident at Pittsburgh, in Pennsylva nia, that gypsum is only useful as a manure in culated to decompose it. It is true that the means principle in gypsum, Mr. R. Bakewell, a correspondent of the Monthly Magazine, proceeds to account for its failure as a manure in so many parts of England. It is enough to dispel this opinion to name the county of Kent, as the place where it has most fully succeeded.

Sir H. Davy in directing our attention to the constituents of this manure, the composition of the soil, and the nature of the plant, has contributed material aids for judging when to apply it: -But perhaps he has not adverted sufficiently to the inimitable chemistry of nature, by which would be pernicious to vegetable life. she may disengage the elements of gypsum when buried in a suitable soil, and enable particular vent. This is naturally present in wood-sorrel, lately in Scotland, the process described in a letter to extract them in a simpler form. It therefore becomes important to recollect, that the sulfihuric acid, which lodges in gypsum in a stances. Peat-moss, in an unreclaimed state, usu-solid state, can be resolved into—sulfihurous acid ally abounds with oxalic acid: hence there is a scale. The expectations from it are sanguine; although the expectations from a ground of recommendation. gas, about 40 parts; and oxygen, 60 parts; and that when the water suspended with the two gases is dissipated, the proportions will be nearly, Condensible into sulphur . . 16 parts.

64 Oxygen 20

100 Now, instead of confining the possible benefit to such plants as afford gypsum in an unaltered state, may we not conclude that a large number of vegetables, constituted to reject the calcareous base ed in plants, or afforded by their ashes, are very tain albumen, (one element in the white of eggs numerous. The sulphuric acid, combined with is sulphur;)—the common dung of cattle. potassa, or sulphate of potassa, is one of the most usual. Compounds of the nitric, muriatic, eulphuric, and phosphoric acids, exist in the sap same base can well be, it may be of practical of most plants." In analogy with some late experiments of De Saussure, we may further supposts of the same strength.

To close this theoretical part, sulphuric acid the chemistry of Nature, may be instrumental in has a great attraction for water, and may be use-converting the starch of plants into sugar. "As ful in a soil in summer. Where the sulphur canwithout uniting with any sulphuric acid or gas, licate aphides by the same impregnation; and it burnt earth is resorted to, as a substitute for the or without forming any gas, we are under the ne. may kill some hardy insects by setting into a hard long tried proportions of consumable manure, the cessity of ascribing the change solely to the fixa-tion of water. Hence we must conclude, that In addition to starch-sugar is nothing else than a combination of already saturated with gypsum or lime, are there starch with water in a solid state. The sulphuric any descriptions of soil on which decomposed acid is neither decomposed, nor united to the gypsum might have a bad effect? 1. Would wise found that long boiling in pure water does iron? This may be put as a caution; for sulnot convert the starch into sugar." This fact phate of iron is pernicious to vegetation; but as opens a large field for rational speculation on the lime is the antidote to that vice in a soil, decom-

Another step in the process of conversion brings us to pure sulphur. Some plants yield this on analysis. Seeds, sown by way of experiment on nothing but this mineral, have produced healthy plants; and many soils, which nature has impregnated with sulphur, are highly fertile.

The peats or loams on which gypsum has been most successful, may contain vegetable acids cal-3. by carbonate of strontian; 4. by muriates of reaped much benefit from the same resource. barytes. Sulphate of alumina is not baneful to plants as a salt, though, as a mineral earthy compound, it is not the most tractable under tillage: but here again lime is present, to prevent its formation, or to dissolve it.

II. Experience of it abroad .- It is about half a century since gypsum was discovered to have in Pennsylvania almost a magical influence on the growth of red clover; and it is there held in ri-sing estimation. The Pennsylvanian farmers seem to have derived from Europe the first suggestions for applying this manure to artificial grasses. M. Gilbert, from whom a quotation is given in Sect. Iv., states the practice to have long prevailed in France with signal success. In Germany, Mr. Mayer, a clergyman, discovered the use of gyp-sum as a manure about the year 1768; and in those parts of the United States that are distant by which human art can at present separate its Voghtland, in Saxony, gypsum earth is said to from the sea not less than eighty miles. On the elements are very limited. It is decomposed, 1. have converted several barren tracts into fruitful hypothesis that sea-air destroys the fertilizing by the oxalic acid; 2. by carbonates of potash; fields. The agriculture of Switzerland has also

[On the subject of Burnt Clay, much has been published in the Farmer, to which we now add

in water: and it is a reasonable suspicion that it not a recent invention: for very particular instructions for doing it are given in a small Treableacher's lees; or salter's refuse, vegetable ashes, tice of paring and burning, but is simply to ope-and water. fy the term to "Burning Clay to improve the Texture of the soil." This is not a verbal distinction, but a practical difference. If attention to it should much contract the field for the operation, it may prevent many disappointments. Thus, suppose the agriculturist is induced, from his system of farming, to cultivate turnips on a clayey soil, not well adapted to their growth, it s plain that the ashes of burnt clay, copiously distributed over the surface, would immediately consult the habits of the plant, by dividing a te-nacious, and rendering drier a humid soil; and thus, without supposing the burnt clay to act as a manure, the texture of the staple would receive a permanent improvement. On the other hand, if on a soil not rich in the common basis of vegetables, and which is to be planted with any of the exhausting culmiferous crops, or other crops result of such an ill-timed application of fire must

Indeed the operation of burning clay for ashes is so tedious and expensive, that even where the circumstances of the land demand such an im-

GUANO-A celebrated Manure used in South America.

With some other curious articles and valuable seeds brought from the Pacific by Midshipman Bland, in the Franklin, he favoured us with a specimen of Guano, and with some extracts in regard to it. These we handed to our obliging Professor of Agricultural Chemistry, Dr. Du-CATEL, and from him we have obtained the " Description of the Guano, or Peruvian Ma-NURE," which follows the extract from Ulloa.] GUANO DUNG.

Extract from "A voyage to South America," by Don Antonio de Ulloa -vol. 2, page 99.

The lands in the jurisdiction of Chancay, like the islands near the coast; and their number being so great as entirely to cover the ground, they before any clay is put upon the mounds. The a crust, and is daily increasing, so that notwithstanding great quantities are taken away, it is never exhausted. Some will have this guano to * The following is derived from the Letter of as at the superficies; whence it is concluded, that Mr. Curwen, of Workington-Hall, to Mr. Dempater, of Dunichen, hublished, by permission, in the Farmer's Magazine, No. LXIV. p. 411.

may be mixed with earth, or that the most superficial part of the earth does not contract the like virtue, so as to produce the same effect. But, however it be, this is the manure used in grain, except wheat and barley; and, consequently, prodigious quantities of it yearly used in agriculture.

NOTE. - The Chancay here spoken of, lies along The specimen of guano dung furnished you was procured at the port of Molienda, a small village a few miles to the north of the river Tambo, in the jurisdiction of Moquehua. This dung is obbirds, all along the coast; and is of two colours and qualities,—the red is considered the best, the white not so good. The white guano is found in great abundance on the island of the village of Iquique, in latitude 20°, 12', S.

Amongst other valuable and curious things it, especially in preparing land for an exhausting brought by Midshipman Bland from the Pacific Ocean, was a small quantity of that celebrated manure, Guano dung, possessing such astonishing fertilizing properties.—Of this article he furnishes the following notice:-

DESCRIPTION OF THE

GUANO; OR, PERUVIAN MANURE.

This substance to which the naturally sterile coasts of Peru, owe their fertility, had already been partially described by Don Ulloa. Messrs. Humboldt and Bonplan have, however, more recently, by communicating specimens of it to Fourcroy and Vanguelin, furnished an opportunity of becoming satisfactorily acquainted with its nature. The analysis of it, made by the latter named chemists, and which is detailed in the 56th vol. of the Annales de Chienie, gave the following result:-

1st. A fourth part in weight of uric acid, partly saturated with ammonia.

2d. Oxalic acid, partly combined with ammonia and potash.

3d. Phosphoric acid, united to the same bases, and to lime.

4th. Small proportions of the sulphates and muriates of potash and ammonia.

5th. A small proportion of fatty matter. 6th. Small proportions of silicious and ferugi-

nous sands.

In Rees' Cyclopedia, the guano is described as a yellowish brown earthy substance, without taste, and of a smell resembling that of castoreum.-The specimen furnished by Midshipman Bland, has a saline taste, and a slight castoreum odour Exposed to the fire, it blackens and emits strong

ammoniacal fumes, as observed by Sir H. Davy. It is found in strata of from 50 to 60 feet in thickness, which are worked on the surface, in the same manner as iron ochre mines. The island of Chinche, near Pisco, on the more southern coast the ashes from the top, and not carry the mound be only earth endowed with the quality of raising of Peru, (no where, however, observes Mr. Humhigher than six feet. THE UTILITY OF THOUGHT,

And the necessity of investigation, to the progress of Agricultural Improvements.

[We have so often, so sincerely disclaimed, personally, the merit ascribed to the journal that we merely arrange and conduct, that we may claim exemption from the charge of any unbe-coming motive in publishing the following extract from a letter lately received from PROFESSOR OLMSTED. We should not do it, if, in speaking well of our journal, he did not inculcate forcibly what we have done in a much feebler manner ; to wit—the hower of thought and the necessity of investigation, in farming as in other things. We believe it to be strictly true, as he says, that most of the leading improvements in the application of manures, in the routine of cultivation, in the construction of Agricultural Buildings and Implements, &c., have originated with men who have, in the practice of other professions, necessarily acquired a habit of study and research, into the causes and principles of what they see and what they have to do.]—Ed. Am. Far. Chapel Hill, N. C. Oct. 12, 1824.

Dear Sir,few leading principles, I have endeavoured to per-

divinity. Accordingly, I have ventured to tell my pupils who were going to be farmers, that they would need but two books, Davy's Agricultural Chemistry and the American Farmer; the former to teach them the philosophical principles, and the latter to teach them the practice of agriculture. I would not, however, discourage them from procuring Taylor's Arator, Sinclair's Code, and several other treatises. Is it not appaare more accustomed to think, than those who warm, with a free circulation of air.

is a clear maxim, that we can do any thing better fore, of such works as the American Farmer, is, I think, to promote among agriculturists habits of thinking, of observation and inquiry; not merely by suggesting new modes of farming, but also by enlightening the mind of the farmer, and rendering him capable of conducting his business with more intelligence and skill.

I trust these observations, sir, will convince you that I place a due estimate upon your labours, and that I desire that the American Farmer may have as wide a circulation as possible.

Respectfully yours. DENISON OLMSTED.

The litter, during the day, should But this poor dog, in life the firmest friend, be removed; in good weather it may be placed The first to welcome-foremost to defend; outside the door, so that the foul vapours and moisture may escape. Horses that work hard, such as post and coach-horses, should always be well littered. To finish the subject of stable economy, (for we say nothing here of feeding,) some remarks must be made on currying or dress ing horses. Friction on the horse's skin is neces sary, not only to keep him slean; it serves also to promote the insensible perspiration, and by the exercise it occasions, the free circulation of the blood is at the same time promoted: but in the moulting seasons, particularly in that which happens in spring, the curry-comb should be laid by nature vite, ennobled but by name, aside.

Each kindred brute might bid thee blush for shame -00

From the Annals of Sporting.

EPITAPH ON A NEWFOUNDLAND DOG.

SIR,-I have much pleasure in transmitting to you, for insertion in your excellant Miscellany, A very erroneous and too general practice is the following Epitaph, by Lord Byron, which is equally remarkable for the beauty and fidelity with which it pourtrays this universal favourite.*

A very erroneous and too general practice is pursued by those who attend to the propagation of feathered game, viz. the destruction of the with which it pourtrays this universal favourite.* It is engraven on a pedestal of white marble, and was situated in a large circular vault, in the

On one side of the pedestal is placed the following INSCRIPTION.

Near this spot are deposited the remains of one who possessed beauty without vanity, strength without insolence, courage without ferocity, and all the virtues of man without his vices. This praise, which would be unmeaning flattery if inscribed over human ashes, is but a just tribute to the memory of BOATSWAIN, a dog, who was here in Nawfoundland. May 1902 and died at the riding school of Valenciennes, there are at this moment the two smallest horses that exist in France, and perhaps in Europe. They are only 30 inches high, and are well matched.

A Russian frigate, fitted out for a two year's born in Newfoundland, May, 1803, and died at Newstead, Nottinghamshire, October, 1808. When some proud son of man returns to earth, Unknown to-glory, but upheld by birth,

* It is said, his lordship once owed the preservation of his life to this faithful animal.

the resultest partiage to observe, that similarly with

Whose honest heart is still the master's own. Who labours, fights, lives, breathes for him alone, Unhonoured falls, unnoticed of his worth; Denied in Heaven the soul he held on earth; While man, vile insect, hopes to be forgiven, And claims himself a sole exclusive heaven. Oh, man! thou feeble tenant of an hour, Debas'd by slavery, or corrupt by power, Who knows thee well, must quit thee with disgust Degraded mass of animated dust. Thy love is lust, thy friendship all a cheat, Ye who behold, perchance, this simple urn, Pass on, it honours none you wish to mourn. To mark a friend's remains these stones arise, I never knew but one, and here he lies.

PROPAGATION OF FEATHERED GAME.

male is the first to commence hostilities, and she no sooner perceives the young birds arrive at a state of maturity, than, as if jealous or fearful of and was situated in a large circular vauit, in the garden of Newstead Abbey, Nottinghamshire, a state of maturity, than, as if jealous or fearing of least of Newstead Abbey, Nottinghamshire, a state of maturity, than, as if jealous or fearing of ble testimony of the improved moral character of rivalry, she furiously attacks them, male and female, and incessantly continues the combat till.

It seems plain, at least that the occupation will not be continued on the same terms.

Rural Economy.

VALUABLE EXPERIMENTS,

To show the difference between raw corn and corn meal cooked, as feed for hogs.

Extract to the Editor, dated, Dec. 18th, 1824. "Some two years ago, while I was confined to bull, it would appear that the committee did not the fire-side by a cold, I amused myself with several experiments to find the increase by weight of corn, rye, shorts, &c. by boiling and cooking, with a view to economising hog food. I soon became convinced, that wonderful effects might be easily produced; and though I then made a regular record of what I did, strange to tell I have never till lately attempted to put my theory into practice. I have had since the first day of December, an actual experiment going on between raw corn and meal, made into good thick mushtwo pigs of about one hundred weight each, have been eating seven pounds each of raw corn per twenty-four hours; and two others of near the same size, have had exactly seven pounds of meal made into good mush between them. This seven pounds meal, cooked into the state of good stiff mush, weighs from twenty-eight to thirty-three pounds. I weighed my pigs accurately at beginning, and weighed again two days since, to mark the progress. The two eating fourteen pounds of corn per day, had increased seventeen pounds in sixteen days-The two eating seven pounds of cooked meal per day, had increased twenty-four practicable. pounds in the same time. Here is a saving of one half the corn. I shall carry them on till early in January, when I shall kill them."

TAX ON DOGS,

FOR THE BENEFIT OF AGRICULTURE. TO THE EDITOR OF THE AMERICAN FARMER.

Cacil County, Maryland, Dec. 18, 1824.

Dear Sir,—I observe by my "American Farmer," received this morning, that at your last meeting of the Agricultural Society "a committee has been appointed to proceed to Annapolis to request the patronage of the State Legislature. Although I highly approve of the plan, and were I a member of the Legislature, I would certainly vote for a handsome annual appropriation for the Chief of the Department, that the most humble

France.—The late King, Louis the 18th, was Society, yet the same thing was attempted last subaltern cannot sleep on his post without being buried on the 25th, with extraordinary pomp. Year and failed, and I fear you will have no better caught a napping!"

The French papers state, that the hearts of terror success this.—Those who take pleasure in agreement of the body of Henry riculture would be gratified at your success, yet the same thing was attempted last subaltern cannot sleep on his post without being buried in Agreement of the process that the hearts of the body of Henry riculture would be gratified at your success, yet the same thing was attempted last subaltern cannot sleep on his post without being buried on the 25th, with extraordinary pomp. Yet a subaltern cannot sleep on his post without being buried on the 25th, with extraordinary pomp. Yet and failed, and I fear you will have no better than the hearts of the body of the process this.—Those who take pleasure in agreement of the process that the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process this than the hearts of the body of the process than the hearts of the body of the process that the hearts of the body of the process that the hearts of 4th, and Maria de Medicis were deposited in St. it may not be so easy to persuade the members of Denis.

The object of this letter is to recommend to your committee, a plan by which The pretended Dauphin lately arrived from the they can realise a large amount of funds for the United States, and on announcing himself, as Society, and will meet with the wishes of all but Charles the Tenth, king of France and Navarre, Foxhunters; you will readily understand, I mean plications, on certain points, to the Legislature, was taken by the commandant of Havre, and put into "a place of safety." a tax on dogs—a certain sum on males and triple that on females; a large amount of funds may be that on females; a large amount of funds may be realised in this way, sheep protected, the State benefitted, and the people gratified. I wish most sincerely they may have recourse to this expedient, because I am confident they will succeed.

REMARKS ON THE CATTLE SHOW, DEVON CATTLE, &c. &c. Baltimore County, Dec. 19, 1824.

animal is frequently overlooked.

subject of some breeds exhibited, which I trust legislation, and the welfare of the community. he will excuse me for correcting, having a perfect knowledge of the animals in question. He states that the heifer Fanny, which obtained the first premium, was out of a cow of mixed "short horn blood," whereas her mother is descended from the Bakewell and Dutch breeds, and has none of the present "short horned blood" in her

It is far from my desire to disparage the "short horn breed" of cattle, which I have always admired for their superior form, early maturity and large carcass, but they require luxuriant pastures and high feeding—the Devons on the contrary, are small animals, very industrious and will do well on thin pastures, consequently worthy of much consideration in this district of country where we are not famous for luxuriant herbage. where we are not famous for luxuriant herbage, or our cow houses in winter extravagantly supplied with food; I therefore hope to see the breed encouraged and extended in our State as much as

it-

Now the fact is well understood that the great of industry. object of Mr. Robinson, the Chancellor of the Exchequer, is to reduce the taxes, in order to relieve the industry of the country. The Edinburg Re-view and the papers tell us, that the merchants in general have determined, during the summer, to prepare for an effort, at the meeting of parlia-1835. This will be a matter of difficulty, unless drawers of water to the Nations of Europe. it is done by way of compromise. The East In-dia Company owes to the amount of 20 or 30 milly to the government. The tea trade is necessary, I think, to enable the Company to pay the interest of this debt. Hence, suppose the Chan-cellor of the Exchequer and the President of the Board of Trade, two as intelligent statesmen in affairs of commerce as ever sat in the British Cabinet, were to make this proposal to the East Inthose produced by slaves.

Of the views of the British Cabinet relative the great agricultural interests of the United States, the planters of corn, cotton, and tobacco? "engine will be able to propel along the rail way, of Salem, from Sumatra, only nine and one quarthese materials? And must not the whole system of the country undergo a total revolution? Habits "it is only necessary to remark, that one steam-cargo of pepper, brought by the General Starke, of Salem, from Sumatra, only nine and one quarther cents, or just one and a quarter cents more these materials? And must not the whole system of the country undergo a total revolution? Habits must change-ideas must alter-and instead of a

of the country bear an infinitely more interesting "baggage, which at present requires three hun-appearance than at present? Agriculture, the no-blest of employments, will prosper, and we shall "fifty hours." We dare to say, capitalists will at last discover that,

"God made the Country-but man made the Town."

Is it not, therefore, the province of every wise man to provide for a course of events, that must

This is a mere speculation as to the immediate conduct of the British government; but it is believed by the writer to be a speculation that eventually will be realised.

He thus closes the subject, and ardently hopes that in future the words of the admirable Fene -

lon, may apply to the United States:

The wealth of the Americans (hetans) con-"sist in health, vigour, and courage; domestic, "quiet, and concord; public liberty, plenty of all "that is necessary, and contempt of all that is "superfluous; an habit of industry, an abhor-"rence of idleness, an emulation in virtue, and a " reverence for the Most High." AMPHICON.

AGRICULTURE.

From the Easton Gazette.

EASTON CATTLE SHOW.

The following reports of the Committees at the late Cattle Show and Fair held at Easton, on the 18th, 19th, and 20th ult. have been politely handed us for publication by Mr. S. T. Kennard, Secretary to the Board of Trustees,

The following are the reports of the respective Committees of Judges appointed to award premiums, which will be read with much interest by all who are friends and patrons of Agricultural

improvement. ..

The Show was a very good one and pretty well attended—the lateness of the season and the coldness of the weather, no doubt, caused many to absent themselves who would otherwise have attended. The whole scene convinces us that the institution gains ground in the public estimation, and we do not hesitate to believe that we shall, at another exhibition, have a considerable increase of members. A farmer's fraternity is a good thing-it is the strongest interest of the country, the most honorable employment for man, and can yield none but good and salutary effects upon all classes and denominations of citizens. How beautiful, how rational is the spectacle, to see all the farmers of our country, from the poorest to the richest, all entering into the most active competition, with kindest and friendliest feelings, to see who can mest honorably gain the greatest share of wealth and comfort for himself and family, and render most service to the community at large? This is "the end and aim" of the Agricultural Society by their Cattle Shows.

It was remarked by strangers, that the sample of Swine exhibited was as fine as had ever been witnessed at any exhibition; but the display of Household fabrics was by all acknowledged to have surpassed any thing that any person present Thomas Wright, of Queen Ann's county. A sinhad ever seen—all the specimens combined ex-cellence of texture, taste, and beauty of appear-mote the raising and improvement of this most cellence of texture, taste, and beauty of appear-mote the raising and improvement of this most ance. The ardour already displayed upon this valuable description of stock, could not fail subject, the many premiums offered, and their to induce them to extend all the patronage they general diffusion will excite emulation, and we were at liberty to confer on the exertions and memay anticipate at our next exhibition still great- rits of those who would be thus laudably engaged.

mens.

trouble to send forward their stock of different kinds, it would add greatly to the scene, and they have been unable to discern in this compeward, and would do credit to the owners of them if they were produced—such persons do themselves injustice, as well as retard the prosperity of our institution, by not sending out their stock—be-sides, the reputation of the Eastern Shore of Maryland, stands at stake in this business, and every farmer ought to contribute his aid to show the advantages and improvements of our country-it is the aggregate character of the stock of a country that entitles it to reputation, and not the production of three or four superior animals.

We hope our farmers will feel this subject as deeply interesting to them, and that a correspondent excitement and exertion will follow.

No. 1.—COMMITTEE ON CROPS.

The Committee to whom was referred the decision of Crops, beg leave to report, that from the accompanying papers they adjudge as follows,

the premium proposed by the Agricultural Soci- committee until the moming of the second day,

ety, for the best crop of Potatoes from one acre when the award was made out and considered of land, viz: 240 bushels-and

To Robert Sinclair, Esq. of the city of Baltimore, for the best crop of Parsnips, on the 1 of an acre of land, the premium offered by the said out of his sorrel mare, the first premium of \$15. Society-he made, as per certificate, from { acre

147½ bushels of Parsnips.

We take the liberty to mention a crop of Mangle Wurtzel, raised by Wm. H. Tilghman, Esq. of Talbot county, (as certified) which does not Mare by old Cauton, the first premium of \$10. quite arrive to the amount probably expected, in consequence of irregularity in standing; but which, from the late season, we deem as worthy of notice, and therefore present to your consideration the amount of the certificate before us, that the crop was at the rate of 2080 bushels per acre,

We were pleased to receive a specimen of Mangle Wurtzel, raised by Dr. Thomas Wilson, of Colt sired by Emperor, was awarded to Mr. Cox's Kent county, of which one weighed 31 and the brown colt seven months old.

other 30 pounds.

Richard Trippe, Wm. G. Tilghman, Wm. Hambleton.

No. 2.-ON HORSES.

The committee on Horses being expected by the rules and regulations of the society for their government to preface their award, by some introductory remarks, as to the "particular objects exhibited or subject submitted to their consideration," feel it their duty to state, that in disposing of the first and perhaps most interesting subject presented to them, they have been unable to indulge a latitude commensurate with the liberal

and enlarged views of the institution.

The merits of the competition for the first such as not (in their judgment) to permit them to um of ten dollars. do more, than award that of the first or highest grade, which has been assigned, with great justice, to the grey Horse Canton, belonging to Col. character of the competition on this branch persons would join the Society and take a little grade. They are very sensible that the premi-trouble to send forward their stock of different ums thus withheld have been contended for, but the hands of our farmers that is not brought for- also aware of the general discretion allowed them by the regulations of the Society, which neverjust regard to the interests, the welfare and obiects of the institution."

There is but one circumstance only which the the second branch of premiums, and which they sincerely regret it was not in their power to acevery hand upon the committee-the servants or To Robert Banning, Esq. of Talbot county, tion. This circumstance was not known to the we have ever seen.

FOR THE AMERICAN FARMER.

ON THE PEACH TREE INSECT.

Sir,-A North-Carolina Farmer has been so obliging as to furnish us (See American Farmer, vol. 5, hage 118,) with his own observations; and also with some notice of the remarks of several other distinguished gentlemen, on the decay of the Peach; which has now become so universal. as to merit general attention. The immediate cause of this calamity is justly attributed by eveletter: ry person, who has written on the subject, to a worm; that perforates the roots of the Peach trees, on which it feeds; leaving our beautiful orchards little better than a barren waste of dead and decaying limbs.

The method adopted by the late Dr. Tilton, of Delaware, to preserve his trees was, it appears, to draw the dirt from the tree in the fall, then to pour boiling water on the roots to kill the worms; and in the spring following to return the soil again to the tree in the form of a hill. Mr. William Coxe, of Burlington, New-Jersey, searched the roots of his trees summer and fall; and finally by opening the ground he left a kind of basin about the trees, to hold water, the freezing of which during the ensuing winter he supposed would destroy any of the worms that might elude his previous search. John H Cocke, Esq. of Virginia, used tobacco, bound round the body of the tree, just at the surface of the earth, encircling the part where the fly that produces these worms deof the fly. But notwithstanding all these various lowing letter to him:methods that have been resorted to to prevent it, we still find that our orchards are decaying; and Dr. Thomas Saythe peach is at this time unknown on many farms Dear Sir,—I enclose a note from Dr. Mitchell that formerly yielded the greatest abundance of which I hoped to have had the pleasure to deliver this delicious fruit.

on this subject, I undertook a few years since to called, and I had but an hour or two to spend in examine for myself and enquire more minutely Philadelphia. into the Natural History of these destructive in sects: hoping that if I could develope their unknown habits more fully, I would be able with to learn from you the proper name and character it a place in your valuable paper. greater certainty to secure my trees from their of this insect; and I hope if we can make this I am, with great respect, themselves, in different stages of their growth, citizens, we will enable them to preserve a tree, all perforating the roots of the trees and cutting than which none can add more to their health and up their substance into small bits like saw dust; enjoyments. but I could not discover any fly that I could suspect as being the parent of these depredators.— On the 22d Nov. 1821, I took up a tree of about during the summer previous, I had taken a numwere all of a whitish colour inclining to brown-

mould boards which the committee think a useful most adviseable to be taken to prevent the deponerally as the common wasp. The wings of the labor saving implement to put in fallow wheat site of the eggs from which they were produced. female flies are of a deep shining indigo colour; where the ground is clear.

A wheat cradle was exhibited by Mr. John
Denny of Queen Anns' which the committee

I continued my enquiries therefore after the parameter while those of the males are rather reticulated, and more like the wings of the common house my awkwardness and ignorance of their habits it.

By The females are further beautified by a scarwas not until the summer before last that I found let coloured ring round their bodies. The speciby chance, at an early hour in the morning, a very mens herewith sent were taken out of the earth beautiful fly near to the roots of one of my trees, yesterday in their pupa or chrysalis state, at the just in the act of emerging from its shell; and root of a decaying peach tree, and kept under a before its wings were fully expanded, I placed a tumbler in my office until the flies have just come glass tumbler over it; and thus to my great satis-out. faction I obtained for the first time a fair view of this formidable enemy of our orchards.

> no difficulty whatever in obtaining as many of concerning this destructive insect. them as I wanted; and I took some of them with Believe me to be. me, while on a visit to New-York, to shew them to Dr. Mitchell, with a view to obtain from him such information concerning them as he might possess. The disease is al-ways attended with costiveness, and the dung that tender: it cuts through the bark and passes down-wards into the root, then turns its course upwards and again reaches the surface by the beginning of (and I am now trying the experiment) but where July following. It is, however, some times diffi-the bandage is dispensed with, the wash ought, I retention of urine take place, probably from a cult to discover the precise place where the worm think, to be applied about the first of September, paralytic state of the bladder. I have sometimes enters, as it is then so small, that the aperture is or I should have great confidence in a bandage of observed, that on opening the stable door, the enters, as it is then so small, that the aperture is scarcely discernible, and hence the very absurd notions that are entertained by many individuals frespecting the propagation of some insects, and the error prevalent in the present case, that the insect while in the winged state, punctures the tree and lodges the egg within the bark. The pupa state commences about the first of July, but more generally takes place about the middle of that month, and is to be found enveloped in its follicle, close to the trunk, among the gummy or I should have great confidence in a bandage of observed, that on opening the stable door, the tobacco leaves or stems; it should be kept on from the first of August to November, and could be kept on from the first of August to November, and could do no damage by being continued, provided it was not itied so close as to cramp the growth of the latter stage of the disease the jaw sometimes becomes locked. It has been clearly proved, by opening horses that have died of this complaint, that the symptoms arise from the stomach being crammed or distendent of the ground; I apprehend, that the distance of the ground; I apprehend, that the distance of power in the stomach it is that causes this loss of power in the stomach, in consequence of which last year my peach orchard was considerably after the complete of the stomach of power in the stomach, in consequence of which last year my peach orchard was considerably after the consequence of which last year my peach orchard was considerably after the consequence of which last year my peach orchard was considerably after the consequence of which last year my peach orchard was considerably after the provided it was the last year my peach orchard was considerably after the provided it was the last year my peach orchard was considerably after the provided it was the last year my peach orchard was considerably after the provided it was the provided it was the provided it was the last year and loude of the provided it was the last year and loude or the

appears probable that different causes may pro-duce the same disorder, but in various degress.— The ball:—Calomel, three drams; The lethargy described by Mr. Poole, which appears to be caused by the plant ragwort, is perhaps the same disease as that which occurred near Swansea, only in a less accute form; and the by ragwort, but less so than the disease which appeared near Swansea. Mr. Poole appears to died of this complaint, and prove, by an experible that the disappearance of the disease may have been occasioned by the improved state of the land, and a want of noxious exhalations in consequence of draining, &c. The staggers which proved so fatal in Glamorganshire, I am inclined to believe, were an epidemic, or rather an ende-mic and contagious disorder. The gentleman of Swansen, who favoured me with his observations on this disorder, says, "I strongly suspect it arises from some poisonous plants in our pastures, which flourish only to a poisonous extent at some particular times, and which have not hitherto been detected. I have mentioned our horses having been attacked the year following our neighbour's great loss, and when they were free from it.— in my report of Novem Most of our horses were purposely kept in the same period, were stable; and I have some idea that they were fed the same period, were upon hay of the same year that our neighbour's horses were fed upon the preceding year." In another part of the letter, he says, "Our neighbours firmly believe it is contagious: they took every precaution to prevent contagion, and the disease left them. I was incredulous, and at this time we had not suffered: a horse from their neighbourhood came to graze in some fields through which our horses passed; he died of this disor-der, and was left unburied: from this time the disorder began with us; but not knowing the circumstance of the horse remaining unburied, I took no precaution. The valuable horse before mentioned was taken ill the next day, and soon died." In the cases of staggers which I have seen, and they are numerous, the disease has never appeared to originate in contagion or infection. When it has occurred at grass, it is gene rally about autumn, and frequently in meadows adjoining rivers, and other situations where the grass at that time is rank, and possesses but little nutriment. The humid and cold atmosphere in such places may perhaps contribute, in no slight degree, to the production of the disorder. The teen thous cases of staggers I have met with which occurred six cents. in stables, have appeared to arise from the horse eating too greedily, swallowing his food when imperfectly chewed, or eating freely of food that is difficult of digestion. Young vigorous horses may digest the most unwholesome food; but such as have been debilitated by hard usage, and are rather advanced in age, become, like a modern bilious man, very weak in their digestive organs, and, when improperly fed, liable to apoplexy or staggers. I am convinced, that the only remedy for this disorder is a mixture of a powerful stimulant with a purgative. From whatever cause the disease may proceed, it has been clearly proved, that the stomach is loaded with undigested food, from a loss of vital energy; I would there-fore advise, in the first place, the following ball to be given. It must be observed, however, that the veterinary practitioner is seldom consulted thousand and sixty-four dollars and twenty-eight rate of about twenty-five thousand dollars per until the disease has made some progress; and it cents.

From considering the variety of circumstances is owing, perhaps, more to the inattention of the and situations in which the disease takes place, it proprietor of the horse, than the obstinacy of the three quarters specified, is

From this statement, it appears that the condi-Making an increase, for this quarter, of twen-tion of the department has been improved, in comparison with the year ending on the first of April, 1823, by a reduction of expenditure and in-S281,275 54. hundred and forty dollars and thirty-nine cents per annum.

The advantages from the arrangement adopted respecting newspaper postage, have not been fully developed, but it has been ascertained, that the Making an increase for this quarter of three receipts for that item have been increased at the annum.

From Bell's Weekly Messenger.

AGRICULTURAL IMPORTS IN PARTICULAR.

We have frequently had occasion to call the atstanding, the delinquent Postmasters and their tention of our readers to the flourishing condition sureties have been found insolvent, and the costs of British trade; and particularly to the excess of suit have been consequently paid by the Department. To avoid as far as possible, a useless one year above another. We have considered, expenditure of this kind, the Attorney of the in equal fulness, the actual state of our imports.

will be in suit, where there exists any probability is, the excess of the exports above the imports, as the actual gain of the country; as if the im-The improvement which has been made in the ports were so much money expended and consuincreased expenditure, by affording additional for them, was the only gain or addition to the mail accommodations on established routes, or by national stock. It is true, that, in all our late transporting the mail on new routes which Conpolitical writers, this error has disappeared; but gress may think proper to establish. it still continues to hold its ground in our news-There are many routes, now in operation, which require greater expenditure than any advantage arising to the public would seem to justify. If these were discontinued, and other routes of more general utility established, the public conmore general utility established, the public constitutes and declarate the general utility established and declarate the general utility established. venience would be greatly promoted without addealer, they equally constitute national wealth, ding to the expenditure of the department. A and equally contribute to the activity of national judicious revision of the mail routes, and of the commerce, with the amount of our exports. For law regulating the Post Office Department, will example, without a good stock of hemp, flax, and enable it, in a very short time, not only to send wool, what would become of our linen and cotton the mail into every populous neighbourhood of manufactures? Without our imports of wine, the Union, but to give every accommodation how would the capital of our wine merchants call which may be desirable to the important comforth so much active labour and industry in all those who supply the article, and invite and force The money lately appropriated by Congress to into the general channel of circulation, so much repair so much of the mail route, from Nashville of the income of our nobility and gentry? It is in Tennessee, to New Orleans, as passes through the same with every other article of import. the Indian country, and which was placed by It is either a raw material of manufacture, and your direction at the disposition of this department, has been applied to the object intended, of the actual prosperity of such manufacture; or except five hundred and ninety dollars and six it is an article of mere consumption, but thereby, giving activity to the circulation of the general capital, affording wealth to the dealers and large As a small sum of money was to be expended capital, affording wealth to the dealers and large in repairing a road of great length, and as the public interest requires that the repairs should be comfortable sustenance to all those concerned in

Now, then, as our limits afford us only the was deemed important, before the commence-means of observing upon the main points of a ment of the work, to ascertain the nature and extended the subject so large and so complicate, we would tent of those obstructions. This was done by the first call the attention of our readers to the acperson appointed to make the repairs; and in last three years. We can afford, indeed, only casionally rendered impassable to the mail, by one sentence to this subject, but that sentence to the principle, that every nation may wisely and high water, were bridged; and swamps, which will speak for itself. In the year 1822, the principle, that every nation may wisely and justly resort to foreign supply, where it cannot raise the required produce at a price within the subject so large and so complicate, we would amount of our exports, according to the official amount of our exports, according to the official report, was twenty-nine million seven hundred thousand pounds. In 1823, about the same sum, or rather short of it, the official figures being, twenty-nine million four hundred thousand pounds. twenty-nine million four hundred thousand pounds, one article consistent with his cultivation of anoth-

Our main attention, however, for the present, has been directed to the average amount of our nency and the object designed, and to report what agricultural imports,—and to their consequences sum would be a reasonable compensation for it.

The balance of the appropriation which refarmer, there cannot be a doubt but that imports mains unexpended, will be applied in making of this amount, of articles which might be raised some additional repairs during the present winter.

I have the honour to be, most respectfully, your obedient servant.

JOHN M'LEAN.

JOHN M'LEAN.

JOHN M'LEAN.

JOHN M'LEAN.

The President of the United States.

Johnston's famous Breed of Hogs.

Johnston's famous Breed of Hogs.

Johnston's famous Breed of Hogs.

Sey, killed a hog of this celebrated breed, the day suredly benefit in the same proportion, as we get cheaper what would necessarily be dear in proportion to its insufficient quantity at home. The

important question, therefore is, whether the interest of the farmer and of the public could not be reconciled,—that is to say, whether the far-mer could not raise the required stock at the same price, so that we might spend our money at home? Or, is the truth of the matter this,—that it is impossible for the farmer to raise this produce at such a price, consistent with the cultivation of more valuable articles? and therefore, although he loses in the price of butter, cheese, tallow, hides, flax, hemp and wool, he has still his due share of profit in the sale of what he actually does raise of this kind, and in the culture of wheat and other crops.

Now, as to the amount of these agricultural imports, they will be found much greater than we had previously any notion of, and, we have no doubt, than most of our readers have ever thought, -so much does exact calculation correct general and loose opinions. The total value of all the wheat annually grown in England does not certainly exceed nine million pounds sterling. Now, will appear from what follows, that the amount of our agricultural imports actually exceeds half of that sum; that is to say, exceeds the annual value of all the wheat grown in England.

The first of these articles in order, though not in importance, is butter-the annual amount of the import of which for the year 1814, was one hundred and sixty-eight thousand pounds. Add to this, the amount of the next article, cheese, which for the same year exceeded one hundred and thirty-eight thousand pounds; and the joint value of our import of butter and cheese, is three hundred and six thousand pounds, or nearly the third of a million.

The next article is tallow, the amount of which, for 1824, was eight hundred and fortynine thousand pounds; and the next article is seeds, which exceeded two hundred thousand pounds,-the two together thus exceeding very considerably a million.

The next articles are hides and skins, amounting in 1824, to the value of six hundred and seventy-five thousand pounds,—and the next, hemp and flax, amounting to a million and a half;—together above two million two hundred thousand pounds.

The next article in order is wool, which, in 1824, exceeded £678,000.

And the next article, foreign spirits (not including rum) about four hundred and forty thousand,-wool and spirits together thus amounting to one million one hundred thousand pounds.

The total amount of the whole together is thus about four million six hundred thousand pounds,

on the valuation of two practical men, who were But, in 1824, (the year finishing in January last,) er. In these cases, what the farmount was thirty-four million five hundred subject, he makes upon another, and he has therefore no cause to complain. The only ground same rate, or nearly, what we now buy of fo-

Unremitted exertions have been made to col-lect the balances due to the department. With in the past year many suits have been brought and IMPORT TRADE INTO ENGLAND, AND judgment obtained. AGRICULTURE.

CULTIVATION OF THE GRAPE.

Sandy Spring, Md. 12th Mo. 25th, 1824. the vine; and as the American Farmer has a than the Memoirs above mentioned, I wish to Respectfully, thy friend, ISAAC BRIGGS.

John S. Skinner.

lack, Esq.

Read June 11, 1811. Dear Sir,-You and I are both old enough to know, that christianity and vine dressing are best many excellent lessons, and I am perfectly content with your practice on them; but on the latter I suspect you have had less experience than myself, and therefore offer you a short lesson country calls for the example, and your situation affords the opportunity of giving it the greatest effect. The lesson shall not only be short, but easy to practice: for I am persuaded, that so much has been said about raising vines, as to have frightened people with the ghosts of difficulties that never existed; the practice really being a very plain, simple business.

That our country is naturally fitted for the purpose is undeniably evident, from the spontaneous as far as we know any thing of its productions. Which is the best of those grapes, remains to be enquired; but it is ascertained, that several kinds of them are superior, for wine, to any of cures them from the ravages of the rose-bug; imperfect, and whithese grapes are the "Miller Burgundy," the to be rubbed off. our own vines.

Thus far you will set down as preface: what

plain common sense only.

tance of cultivating the grape in the United and again at two inches below the eye, cover both cases all the eyes below are to be carefully States, is more and more seen by our agricultueach end with a sticking plaster of any kind, rubbed off. each end with a sticking plaster of any kind, rubbed off. ral citizens, and their attention to it more and and set it in a pot of garden mould (about 5 or 6 but, like other plants, it grows best in the best season. soil. When first removed, water it at a distance Here more harm than good, and does most injury in the below the lowest clasper be rubbed off. taught by example. On the first you have had driest time. As the vine shoots upward, it must be supported from falling. No other care than keeping the ground clear of weeds is necessary for the first summer. In November, a slight ward all the side branches from the shoots of the covering of straw or indian corn husks, is benefiyear are to be rubbed off; taking great care not upon it, and recommend that you practice on this cial in preventing a frequent freezing and thaw to injure the leaf from whence they spring, which also, with an equal zeal. The interest of our ing of the vine. In February it must be trimmed; is the nurse of the bud at the root of its stem. ing of the vine. In February it must be trimmed; is the nurse of the bud at the root of its stem. and here commences what I conceive to be the written on this subject.

production of the vine in every part of the sea rate pith. This most important circumstance cost, from Georgia to Maine, and to the westward commences at the lowest leaf that has a clasper. rate pith. This most important circumstance probably many succeeding years. opposite to the leaf. A solid woody substance mended, rather than a cutting of sixteen inches passing from the leaf to the clasper, through the long, it is replied, that roots shooting from a sinvine, and connecting them together, cuts off en gle eye, are exclusively from itself, are much tirely the communication between the pith and the strongest, and strike more directly downthose called European grapes, hitherto imported the joint below, with that of the joint next above; ward; the shoot from it has less pith in it, the into this country.—For example, the bull or bulland so on, upward, at every joint through the wood is firmer and shorter jointed, and comes whole length of the vine. And it is a circumstance of New Jersey,* all of whole length of the vine. And it is a circumstance of New Jersey, all of whole length of the vine. And it is a circumstance of New Jersey, all of whole length of the vine. And to these important which stand our climate perfectly well, without all the eyes below his first clasper advantages may be truly added, that a thousand one control in the less pith in it, the covering; and their fruit, instead of being injuare formed in the bosom of smaller and more plants, fit to set out, may be raised from the red by the frost, as all the European grapes are feeble leaves; and that the base of these eyes single eye with less labour and within less space, known to be, is improved by a slight frost. Of does not extend across the vine, so as entirely to either in a hot bed, or in the open ground, than the European grapes, the downy leafed vines cut off the pith of the joint below, from that of a hundred plants can be raised from long cuttings; have the important advantage, that the down set the joint next above it; these eyes are therefore which have not, that I know of, one single adimperfect, and whenever you trim the vine, ought vantage in their favour: and, in a new country,

"White Morrillon," and above all others, the Genuine Tokay," which to the advantage of begin to apply the principle above laid down, the hoary leaf, adds that of producing the best and it is here only that there ever can be any As to the manner of accommodating your vine to wine in the world; and growing in a country eight difficulty in the application of it: and this diffilits situation, an active imagination would suggest or ten degrees further northward than we are, culty can only arise from the circumstance of so

TO THE PUBLIC.

The Institution of the Veterinary College not appearing to be so generally known, as an Establishment of such public utility, of such national importance, is thought to merit, the Governors conceive that a short statement of its views and objects may be acceptable to those who are still unacquainted with it.

The extreme ignorance and incompetency of the greater part of the practitioners on the Dis-eases of Horses, called Farriers, had been long and universally complained of. To remedy this, and meet the evil in the most effectual manner, several gentlemen formed themselves into a Society for the Improvement of the Veterinary Art. A large piece of ground was provided, and a range of Stables, a Forge, a Theatre for Dissection and Lectures, and other Buildings have been erected, at a considerable expense. A medical gentle-

The cuticular coat ends ab-ruptly by a fringed end, and is very distinct from the villous coat. The villous coat being much larger in extent than the muscular, is thrown into folds, which are more considerable than those of the cuticular coat, and are largest towards the great extremity; towards the duodenum they become less, and when at the pylords they form a fold that makes a kind of valve to this part of the stomach, preventing a return of the food, and its too speedy passage out. The folds not only hinder the too hasty passage of the food, but, by this means, apply the gastric juice more certainly to all the parts: but the principal end is to increase the secreting surface, which is here Stomach.-The horse's stomach is very small, essentially necessary, as only one half of the owner, or any person sent by him, till the amount the diaphragm, principally on the left side, with saliva; for were the food to come into the stoof his keep up to the day of delivery be paid.

AGRICULTURE.

TREATISE ON SOILS AND MANURES-Correctives of ill-constituted Soils.

The last extracts under the above head, given in Number 40, treated of Gyhsum, or Plaster of Paris as a manure—and of burnt clay.—What follows is highly worthy of a place in this journal, and of the attention of its readers-They will find condensed in short paragraphs, all which is of practical utility, in relation to a variety of manures, of great value, though too generally, either not known, or too much neglected. A good farmer should have a receptacle for every species of offal, for all is convertible into manure. Not a bone nor a feather should be thrown away-economy is always and every where commendable; and wastefulness, is only less reprehensible than the avarice of the rich. which is of all things the most disgusting and detestable.] - Ed. Am. Far.

IX. By Manuring with Refuse Substances not excrementitious .- Heaps of refuse matter, which contain excrementitious substances incidentally, under this article.

1. Street and Road Dirt and the Sweepings of Houses may be all regarded as composite manures. As they are derived from different substances, their constitution varies; but in all cases they refresh and strengthen a soil. Scrapings of roads not clayey are beneficial without exception: those from high-roads are enriched in far the greater degree by the droppings of cattle.— The promiscuous dung which is gradually incorin many cases beneficial in a higher degree than the cultivator might expect from its known composition: but the greatness of the benefit may be well accounted for, by considering that the gravel, or slate, or stone, which is ground into earth by the passing of carriages along a road, is neces-

basis is charcoal, in a state of solubility by the of air and water. action of air and water. It contains also salt of ammonia, with a portion of oil. To mix soot with quicklime is a bad practice; because much volatile alkali is thus disengaged, without any benefit to the land. This manure requires no preparation; and is well fitted to be used in a dry state, as a top dressing (a peck to four square poles of land) thrown in with the seed. It is a der they might be used in the drill husbandry, and good improver of cow-dung and goose dung; either delivered with the seed, in the same manner as of which alone, and in a fresh state, are of little rape cake. power. Further, its alkali tends to make oily particles miscible with water.

3. Coal-Ashes.—It appears from an experi-ment of Mr. Wright, afterwards particularly adverted to, that coal-ashes on a plot where barley is to be grown has the same efficacy as hog dung; while it is inferior to the dung of sheep, and

something better than that of horses.

4. Coal-Water, or the liquor produced by the distillation of coal, is said to be a good manure.

5. Wood-Ashes consist principally of the vegetable alkali united to carbonic acid: and as this alkali is found in almost all plants, it may be an essential constituent in the organs of the greater part. The vegetable alkali has a strong attraction for water. See the comparative efficacy of wood-ashes with that of coal-ashes and the dungs of several kinds of cattle and domestic fowls, un-

der X. 6. [In next Farmer.]
6. Carbonate of Ammonia.—The liquor pro-Vol. 6.-43.

manure on the following accounts. First, it prin cipally contains carbonate of ammonia; sccondly, it contains also a little sulphur. In the propor- the residuum of the stills as a worthless article: tion of one gallon to 16 or 18 of water, this liquor but surely if some competent person were emmay be applied to all green crops as a manure, ployed to separate the sulphate of soda from the with good effect. When the object is to destroy sulphate of manganese, the former might be turn-insects, three gallons only of water should be added to a good account. The waste solutions of the

carburetted hydrogen gas is beneficial as a ma-nure, conveyed in proportionate heaps of earth the property of accelerating and enlarging the or marle. One gallon of this tar being mixed growth of vegetables. Gardeners whose grounds with about a wheelbarrow full of mould or fit are in the neighbourhood of bleachfields, would earthy materials, will form a compost of great do well in availing themselves of all the advantaactivity. This may be either ploughed in or used ges their situation affords them for making expe-

8. Bones consist of phosphate of lime and de-composable animal matter. Bone powder, bone phosphate of lime is to be supplied to a soil .-Bone ashes ground to powder will impart a reduced share of benefit to arable lands, containing and but in a small proportion, will be included much vegetable matter, and may perhaps enable mild lime and quicklime, either of which, when soft peats to produce wheat; but powdered bone, in an uncalcined state, is always to be preferred to bone ashes, because the oil and other animal cheaper rate. matter with which bones are richly charged has not been dispelled.

9 Horn is still a more powerful manure than

fects on a soil.

porated with the sludge, is so perfectly reduced by exposure to the weather, that it takes the appearance of earth. The effects of road-drift are quantity of albumen (a substance similar to white vegetable life. Thus tallows and oils, received in allied to horn than to bone; they contain a great they are ill adapted to promote the functions of quantity of albumen (a substance similar to white vegetable life. Thus tallows and oils, received in egg,) gelatine (basis of jelly,) with some oil.-Woollen rags act powerfully for one year.

in different manufactories-such as furriers' clippings, the shavings of the currier, and the offals

* The carbon and hydrogene abounding in oily to support vegetation. Fine road-stuff is better than dung on pasture land.*

2. Soot is a very powerful manure; its great the substances of their durability is easily explained from the gradual manurer in which they change by the action

Bones are much used as a manure in the neigh hourhood of London. After being broken, and boiled for grease, they are sold to the farmer.— The more divided they are, the more howerful are their effects. The expense of grinding them in a mill would probably be repaid by the increase of their fertilizing powers; and in the state of pow

Bone dust, and bone shavings, the refuse of the turning manufacture, may be advantageously em-

ployed in the same way.

The basis of Bone is constituted by earthy salts, principally phosphate of lime, with some carbo nate of lime and phosphate of magnesia; the easily decomposable substances in bone are fat, gela tine, and cartilage, which seems of the same nature as coagulated albumen.

According to the analysis of Fourcroy and Vau-

quelin, ox bones are composed Of decomposable animal matter 51 — phosphate of lime
— carbonate of lime
— phosphate of Magnesia 37.7 10 1.3

M. Merat Guillot has given the following esti mate of the composition of the bones of different

duced in the distillation of coal at the Gas Es-lof the tan-yard, and the glue-maker-form highly tablishments, may be recommended as a valuable useful manures; any one of which, buried in the soil, operates for a considerable time.‡

12. Bleacher's Waste.-It is usual to cast away ded to one of the liquor.

7. Coal Tar.—The tar produced in making luable manure. Humboldt, about 1810, discovered that a weak solution of such preparations, has as a top-dressing, as the nature of the land and riments on this interesting and important subject. The waste lees, after boiling linen yarn or cloth, may also be used for alkalizing composts.

13. Soaper's Waste has been recommended as shavings, and bone ashes, are serviceable where a manure, under, the supposition that its efficacy phosphate of lime is to be supplied to a soil.— depended upon the different saline substances which it contains: but the quantity of these is very minute indeed; its chief ingredients are a supply of calcareous materials, or when a caustic solvent is wanted in a soil, may be had at a

14. The Fluid, or Dissolved Parts, of Animal Substances, require some preparatory process to fit them for manure. The great object is to blend bone, as it contains a larger quantity of decompo-sable animal matter:* it is very durable in its ef-vision. When these have been applied in a rank vision. When these have been applied in a rank or unreduced state, bad effects have followed .-10. Hair, Feathers, and Woollen Rags, are all Perhaps while they retain the combinations of ania crude state by the roots, may clog the pores of the bloated plant, repel dews and aqueous fluids, 11. Refuse of Skin and Leather, accumulating and obstruct the free communication of the leaves with the atmosphere.

One mode is, to spread the animal fluid thinly on the land under tillage, and previous to putting

Ivory	64	1

The remaining parts of the 100 must be considered as decomposable animal matter.

Horn is a still more powerful manure than bone, as it contains a larger quantity of decomposable animal matter. From 500 grains of ox horn, Mr. Hatchett obtained only 1.5 grains of earthy resi-duum, and not quite half of this was phosphate of lime. The shavings or turnings of horn form an excellent manure, though they are not sufficiently abundant to be in common use. The animal matter in them seems to be of the nature of coagulated albumen, and it is slowly rendered soluble by the action of water. The earthy matter in horn, and still more that in bones, prevents the too ra-

rid decomposition of the animal matter, and renders it very durable in its effects *

* A mercantile house in Hull imported bones for manure, in the course of last year, to the amount of forty thousand pounds.-Ed. Am. Far.

Elements of Agricultural Chemistry, p. 199. Chemical Essays, by Samuel Parkes, F. L. S. London, 1815. vol. IV. p. 160.

The better mode is to convey animal mat-

When sugar-baker's waste has been reduced to the finest state possible, it will still be improper for application as a manure, until it has been mixed and incorporated with three or four times its bulk of some earthy substance, which may be enriched with a proportion of vegetable mould or desiccated dung.

Graves also are too rank both for corn and grass, unless conveyed in a compost of earthy materials; wood ashes may be profitably added, a manure, which, with one horse, will crush five affords nourishment to plants; but there is an obas having a tendency to divide and correct the par-

ticles of tallow.

Oily Substances contain a deal of carbon, and are employed as manures with great advartage. Animal or vegetable alkali increases their fertilizing power, by converting them into soaps .-Quicklime diminishes their efficacy, tending to make them insoluble. Train-Oil and Blubber.— All the practical writers on the application of train-oil and blubber, and similar refuse, agree that to rectify it, it must be made into a compost with a great body of earth, though they may recommend different proportions under the diversified circumstances on which individual experience is founded.

The ingenious Dr. Hunter* advises a compost thus formed: Let 12lbs. of American potash be dissolved in four gallons of water: mix the solu-tion with twenty bushels of dry mould, and four-

teen gallons of train-oil.

A Correspondent of the Farmer's Magazine found that blubber in a crude state, as he applied it in a first essay, destroyed, instead of assisting vegetation. Twelve years' experience has led him to a most successful method of using it, which he presents to the notice of other agriculturists. His pian is to make it into a compost in the proportion of nine loads of earth to one load of blubber. He first makes a layer of earth two ing a dead animal with six times its bulk of soil. It is too valuable to be used on common occasions. feet thick, -building it a foot higher at the sides, mixed with one part of lime, and suffering it to alone. It may be mixed with sand, perfectly rot three feet inward, like a solid wall, to form a remain for a few months, the decomposing carcase ted dung, exhausted bark, or other ingredients, cavity for the blubber. When the blubber has is made to impregnate the superincumbent mould according to the wants of the soil. been laid on a foot in depth, similar layers are re- with soluble matters, so as to render the compeated to a convenient height till the blubber is pound an excellent manure; and by mixing a litexpended, leaving three feet of earth for the top the quicklime with it at the time of its removal, layer; The entire heap is then beat down close the disagreeable effluvia would be in a great meaat the top and sides to exclude the air. lands, and are much celebrated for their good effect. Professor Davy, having analysed as well these ashes as the soils to which they are successfully applied, found in the soils themselves no sensible quantity of gypsum; the ashes, on the other hand, consisted in great part of gypsum, with a little iron, a little common salt, and variable quantities of calcareous, aluminous, and siliceous earth, and sulphate of potassa. But such is not generally the case with peat ashes: to produce this preponderating quantity of gypsum, the due this preponderating quantity of gypsum, the in the one case, for the calf, from a cow, without a fedigree, as "she was the only one offered to the abundant productions of the earth, so little bull only. who are particularly entrusted with the interest Ignoramus, had not supposed, that the blood of the whole. "What have you done for the plan-

Esq. † Elements of Agricultural Chemistry, p. 19.

ters and farmers? is the usual question asked counties, than the manner of raising and keeping voted for it!" Thus have we been, from time to time, put off with excuses; and at the next eleclature? However, this mode of reasoning and those insufficient excuses will no longer avail, for I see with much pleasure, that the "Agricultural Society of Maryland" have appointed a commit-tee, to make "propositions;" and from the cha-racter of those gentlemen who compose it, we are satisfied that judicious "plans" will be sub-mitted to our legislature. It will then hereafter be incumbent upon the agriculturists, throughout the state, to scrutinize minutely the objections and listen to the just complaints of planters and farmers, require better evidences of the existence, or abler suggestions for remedying some of the evils, than may be found in the "American Farmer" within the last several weeks? Although there are a variety of modes recommended; yet any one, would contribute greatly to alleviate proper attention to vegetables, I have not the some of their grievances. From the "committee least doubt of its being preferable to any other.

I have given these particulars as an evidence, tivators of the soil do anticipate not only a favourable report, but efficient measures. It would be too much to expect for that committee, that they should embrace all the details requisite to a perfect plan for the promotion of agriculture, as it requires several distinct and seperate laws to remedy all the evils. The revision and amendment of the "law of trespass" generally:—a law for the protection of sheep, and consequently the taxing, chaining, keeping at home, or killing superfluous dogs :- and a law to compel the owners of hogs to keep them within their own enclosures, or the right to those trespassed upon, of killing when found on their land. These are, I consider, more or less indispensable to all concerned in agricultural pursuits, and equally just to all classes in society. Upon the subject of sheep and sheep-killing dogs, enough has been published in the American Farmer, to satisfy our delegates, even those who consider themselves most invulnerable, that something must be done, or it is to be earnestly hoped, that they will hereafter have nothing to do. The destruction of sheep by dogs within a few years past, has been so ruinous to the raising of that stock, that in many neighbourhoods the attempt is entirely abandoned; and in that in which I reside, formerly remarkable for good sheep and great numbers, I believe I can discussed by some able hand. with truth say, that there is not wool sufficient to furnish stockings for all the families. It would seem as if the dogs had anticipated a declaration of war against them, and like prudent politicians have commenced the attack, for within the last ten days they have reduced the small remnants of flocks to one half, and in some instances to less than one-third. Now let those of our delegates who are such advocates for the "people" calculate whether it is more to their interest, to pay a higher price for the wool, requisite for family purposes, or to keep fewer dogs at a lesser ex-pense. It is to be regretted that many of those essays in the American Farmer are not re-published in some of the country newspapers; much good might be done to the farmers and planters, and then our delegates could not plead ignorance of the existence of such evils.

There is no part of agricultural economy less attended to, or less understood in these lower formerly hung heavy upon it?

upon the return of our delegates from Annapolis hogs; and no stock is more destructive to our and the answer is equally ready: "No filan or neighbours, or troublesome to ourselves, when permitted to range at large. Those who will proposition was suggested, in which they were permitted to range at large. Those who will immediately interested, or I certainly should have make the experiment, with few exceptions, will find it to their advantage not to permit their hogs to run at large, particularly if their neighbourtion, very zealous to support the same delegation, hood is infested with either two or four legged because "no plan or proposition came before the dogs. During the last year necessity compelled legislature." And pray whose fault was it that me to pen my pigs, or have no pork; thirty were no "plan or proposition" came before the legisning through it, on the 15th December, 1822; the pigs were from two to four months old: a beef was fattened in the same pen until March: I gave them two ears of corn a piece, night and morning .- After my wheat was gathered in, they were let into the stubble field until the scattered grains were consumed; then penned again, fed on apples, pumpkins, &c. &c. with corn: they were slaughtered the 20th December last. I have never had such good pork, and am convinced that the difficulties which may be opposed to the success same weight of meat would have cost me more by of their efforts. Can men who are disposed to raising them in the common way; and have been listen to the just complaints of planters and far-saved much trouble, vexation, and loss by straying and their being stolen. Although there is an extensive marsh attached to the farm, as well as a pretty extensive wood range, I shall pursue the same mode again, believing it to be the most eco-nomical. With the advantage of clover, and a

> in favour of the hog law. Suppose this practice was pursued; the necessary fencing for all other kind of stock, might be made of a post and three rails ;-whereas, to be safe from hogs, it requires at least five with posts, and of the common worm fence from nine to eleven rails. The difference in the saving of timber, especially in districts of country where wood is not abundant, would more than pay for all the pork required upon the farm, without taking into the account labour and other considerations. But independent of these, is it not right that each individual should be compelled to keep his stock off his neighbour, and not put him to the expense of making fences where he would not otherways require them? Should our legislature pay a due regard to these matters, the end of the year, which has just commenced, will bear striking evidence of the judiciousness of their enactments, and the agriculturists may congratulate themselves that they are no longer misrepre-A Furmer of Charles County. sented.

-0-To the Editor of the New-York Gazette.

Gentlemen-Permit me, through the medium of your useful paper, to propose the following Queries to the public, in hopes that they may be

1st. Is it not possible that the English government will, upon hearing of the discrimination in the duties upon their manufactures in favour of American citizens, lay an additional duty upon cotton when imported or even owned by a citizen of the United States?

2d. Will not the English (or even French) government, probably lay an export duty even upon their own manufactures, when exported or owned by a citizen of the United States?

3d. Will not the large manufacturing population in England and Scotland, petition their go vernment to enact the above laws?

4th. Is not this proposed law in direct opposition to the treaties with Great Britain?

5th. Why is Congress laboring to put restrictions upon trade, whilst the government of Great Britain are doing all in their power to free their

6th. Are not the commerce, riches, and the amount of imposts in England, increasing rapidly under this their new system?

Remarks by M. M. Noah, Editor of the New-York National Advocate.

We have been looking for some queries on the above subject, which will be admitted is of great interest to the general prosperity-and as such, should be approached with caution.

The secretary of the treasury in recommending discriminating duties, gives the following rea-

"But whatever motives there may be for allowing a credit for duties to our own citizens, no sufficient reason is perceived for continuing it to foreigners, who are not domiciliated in the republic. A discrimination, in this respect, between citizens of the United States and others, would tend to confine the commerce of the nation to its own citizens, and would aid in restraining the practice of shipping merchandize to this country, upon consignment, for foreign account, which has hitherto been found to interfere with the interests of our own regular merchants."

Accustomed as we are to receive the opinions of the secretary, with great deference, arising from a confidence in his experience and integrity, we are nevertheless constrained to doubt the policy of enforcing any distinction in the collection of duties, and the objections to the measure as detailed above, struck us forcibly on reading the official document. We are, undoubtedly, bound to afford protection to our own citizens, but it is very questionable, whether "confining the commerce of the nation to our own citizens," would not very materially abridge its advantages and curtail its profits. We export a very small proportion of our imports; as we are consumers, therefore, the more free and unrestricted we are in our commercial regulations, the greater will be the field of enterprize and competition, and the cheaper will be the commodities actually required and consumed.

The honorable secretary admits, that, while cash payments for duties would prevent loss, it would "probably diminish the amount of duties," and shortening credits would produce the same results. Policy, therefore enjoins us to avoid measures which may impair the revenue, or create distinctions and classifications among merchants, which may result in retaliatory decrees.

Suppose, as a measure of retaliation, a duty should be laid on cotton in England, the property of Americans, would it not seriously injure the growers of this article in the south? Suppose the French government should shackle our commerce by special export duties, would it not equally impair our exports and staple article to France? If the discriminating duties in question are prohibited by treaty, there the thing ends at once.

But all reasoning on this subject fails from the admitted impossibility of enforcing the system .-The moment a law passes which compels foreigners to pay cash duties, not a bale of goods will be imported in the name of a foreigner; and the moment England passes a retaliatory law, no cotton will enter in the name of an American .-Nothing, therefore, being more feasible than an evasion of the law, it would become a dead letter, though surrounded by a battery of oaths.— We had better allow our commerce to progress, as it now does, prosperously and satisfactorilythrowing open all its avenues to the enterprising capitalist, and enriching our country with the product of every clime, filling our national cof-fers, decreasing our national debt, improving our commerce from all the burdensome weights which national resourses, and receiving in our national family the industrious of every clime.

Internal Improvements.

[Communicated for the American Farmer.] CONSTITUTION

Of the Pennsylvania Society for the promotion of Internal Improvements in the Commonwealth.

I. This Society shall consist of as many members as shall sign this constitution: and its object shall be, as designated in the title, to promote internal improvements in the commonwealth.

II. The officers of the Society shall be a President, three Vice Presidents, a Recording and a construction and reparation of roads to the con-Corresponding Secretary, and a Treasurer; who sideration of their fellow citizens. ber of the present year, and on the first Tuesday in January, in every year after 1825. The offi-cers chosen at any election shall retain their offices until the appointment of successors.

III. The President, or, in his absence, one of the Vice Presidents, or, in their absence, a Chairman chosen pro tempore, shall preside at the meetings of the Society. The President shall call extra meetings whenever requested by six members in writing, whereof six days notice shall be given.

IV. The Recording Secretary shall keep fair minutes of the proceedings of the Society.

V. The Treasurer shall receive all monies belonging to the Society, and keep correct accounts present to the Society at the stated meetings. He them. shall pay no monies but on the order of the Pre-

sident, countersigned by the Secretary.
VI. The society shall hold meetings every two

May, July, September, and November. VII. An acting committee, to consist of five members, shall be appointed on the second Tues- monwealth. day in December of this year, and at the first It has been frequently remarked by our citimeeting of the Society in every year after 1825; zens who have visited the eastern states, that in be the reverse of digging a trench. The road which committee shall perform such duties as those parts of the Union, the town roads, which should not be sunk below, but rather raised above may be entrusted to them by the society, and are the same as our public highways or township the ordinary level of the adjacent ground. Care shall have charge of its correspondence. The roads, are better made, and are always in better should be taken that there be a sufficient fall from Corresponding Secretary shall act as secretary of this committee, and shall keep its minutes.

VIII. The subscription for the first year shall be one hundred dollars, payable in four quarterly society. The subscription after the first year shall be ten dollars per annum.

Nov. 30, 1824.

Extract from the By-Laws.

The Acting Committee shall open a correspondence with the friends of internal improvements in the United States and elsewhere; with all such information, in relation to the objects of the society, as can be procured; and shall from time to time report their proceedings, and such other matters as may be interesting to the society, and as may contribute by their statement and promulgation to the purposes for which it is established. The committee may submit for the consideration of the society, plans for public improvements, and such estimates of their cost, and of the means of their accomplishment, as can be procured without expense; unless the expendi- large stones scarcely ever consolidate. ture of money for the purpose of attaining such estimates and plans shall be specially authorized by the Society, They shall keep accurate minutes of their proceedings, which shall be submitted to the society at every stated meeting.

SECTION I.

On the Construction of Roads.

pairs is regulated by the correct or erroneous

Roads in our state are of three descriptions-VI. The society shall hold meetings every two roads, both of which are made and kept in or-by drains or ditches. The means by which to months, on the first Tuesday of January, March, der at public expense—and turnpike roads, which produce these effects, are detailed in his work at have been constructed by private capital, and length, and in his various examinations by order by large and liberal contributions from the com-

order than the same roads in Pennsylvania. Why the road to the adjacent ground to take off the this is the case, it will not be difficult to show, water, so that this ground be some inches below instalments, the first on the organization of the ever, only intended to invite the attention of the are indispensably necessary. citizens of the commonwealth to the known and

who have charge of public works in the United the purpose of this paper particularly to call the conduct water, be mixed with the broken stone, States; and with those who are skilled in the public attention, and by a statement of the error which must be so prepared, and laid, as to unite science of civil engineering. They shall collect neous principles upon which they have been by its own angles into a firm, compact, and immade, and an exhibition of a better mode of con-penetrable body. structing and repairing them, it is hoped extensive benefit will be obtained.

In the formation of our turnpike roads we com-

mit four great errors :-1. We dig a trench in which to place the large the upper stratum loose, and open for the recep-stones which are the foundation of the road, and tion of rain water. which receives the water that percolates through, and undermines and loosens the coat of broken is to be laid on, not all at once, but in layers of stone, which forms the cover of the road. Those three inches thick; after the first layer is laid on,

basin for the reception and detention of rain.

if cut, it is very seldom kept free from obstruction. on the turnpike.

At these errors we are not to wonder; for England, with centuries of experience in roadmaking, and tenfold the experience of turnpikes that we have had, has until lately pursued exactly the same career, which, even at present, is continued in many parts of that island. But a new system has been introduced there within a few years past, by Mr. J. L. M'Adam, which has The Subscribers, the Acting Committee of stood the test of the most rigorous scrutiny—and received the most unqualified approbation of parameters. liament-of the postmaster general-of the promost enlightened persons in the nation. It forms no slight recommendation of this system, that Mr. M'Adam, and his family, under his direc-tion and on his system, have been and are employed in the construction and repair of different roads to the extent of nearly 700 miles-and that he is consulted, and his plan followed, by the major part of all the road-contractors in England.

The leading features of Mr. M'Adam's system are—that the best foundation for a road is the natural soil; that this foundation, on which the broken stone is to be laid, ought to be eleva-The proper construction and preservation of usually termed the side or summer road*—that public roads are objects of the first interest. Their the stones should be broken so as not to exceed permanence depends entirely on the manner in six ounces in weight (he has recently declared a which they are formed, and the expense of re-preference of three,)-and so completely consolidated as to prevent the penetration of rain-that of the receipts and disbursements, which he shall principles adopted by those who have charge of the stone should be as far as possible homogeneous, as the mixture of hard stones with those easily friable is highly pernicious—and that the bed The great public highways, and the township of the road should be secured against under water the following plain rules:-

Scraps from English Papers.

The Grand Signior, conceiving that his disasters with the Greeks are owing to the Turkish women wearing thin veils and casting wishful looks at the men, has issued the following firman:

"Since the women must never, when they go out, deviate from the rules of decency and honour, it is especially necessary to take care that none of their actions be contrary to the holy law.

"An imperial firman has already been published to hinder them from wearing embroidered feredges and improper colours. The duty of the Dean Swift's barber one day told him that he officers to whom that firman was addressed was had taken a public house. "And what's your mon Red, or Cayenne Pepper, but have not been sign?" said the Dean. "Oh, the pole and basin; enabled to effect it to my satisfaction; it has so great a tenacity it is impossible to reduce it to powder, and to attempt to dry it by the fire, it will have not doubt but it would draw me plenty of customers."

The Dean took out his pencil and waste the following the formula of the duty of the officers to whom that firman was addressed was to see its execution. Thay have not done so.—In these latter times, therefore, certain women have been seen to change the tone of decency and homour for manners least becoming Musselmans. They have not feared to wear embroidered fefer their faces to be seen.

Colonel Trench, for Then dread our might in equal fight, Oh Johny Bull my Joe. making a quay on the north bank of the river Thames at London, held on the 2d November, it was resolved to carry the undertaking into effect. £611,000 is considered an adequate sum; it is to be subscribed in £100 shares. Mr. Wyatt is to be architect, Mr. Rinne engineer.

It is repeated that Mr. Broughman will be appointed one of the King's counsel.

A dreadful fire had taken place in Fleet-street. Now Johny Bull my Joe John, in commerce let's unite, London. It commenced in the shop of Mr. Bond, We'll give you cheaper lead John, than in the field of fight; linen draper, No. 87, and extended to several of At Ohlkans it was dear John, I guess you found it so, the adjoining premises, and caused a destruction. The 8th will tell the tale full well, Oh Johny Bull my Joe. of property to nearly the amount of £100,000 sterling. No lives were lost.

>0 NATIONAL REVENUE.

Treasury Report.—It appears from this report that the actual receipts into the Treasury for the year 1824, are estimated at \$26,980,893, 96, which with the balance of 9,463,922 81 remaining in the Treasury at the commencement of the year, form an aggregate of \$6,444,816 77. and the expenditures during the year, including tree about eight years old. 4,775,671 99 paid awards under the Florida treaty, and 16,568,413 76 of the public debt, leaving an existing balance of 4,506,668 91; subject, how-ever, to the payment of appropriations already made.

The public debt on the 1st of Jan. 1817, was 123,491,965 16, of which 115,257,806 48 were funded, bearing an average interest of 5,561 per centum per annum; and on the 1st of Jan. 1824, the whole debt was 86,045,003 18, bearing an average interest of 5,361 per centum per aunum; while the government hold 7,000,000 capital in the Bank of the United States, which would reduce the actual debt to about 79,000,000; being about 5-8ths of what it was eight years ago; within which time about 5,000,000 have been paid for the purchase of Florida.

The excess of receipts over the expenditures, including the annual payments of the public debt, will be about 3,000,000, until the close of the year 1835; after which time, the debt being then entirely discharged, there will be an annual addition of 10.000,000 to the amount, applicable to such objects of defence and for the welfare of the nation as may be deemed expedient and proper .-Del. Gaz.

LARGE LEMONS.

To the Editor of the American Farmer-with two

THOS. EDMONDSON'S compliments to Mr. SKIN-NER, presents him two Lemons on a twig, from a

Harlem, Jan. 4th, 1825.

Balt. Md. Ag. Society's Room, 11th Jan. 1825.

J. S. SKINNER'S respects to Mr. EDMONDSON. and acknowledges with many thanks his interesting present of two lemons on a twig-the fruit of most extraordinary size-evincing equally the skill and care with which they have been raised. They will be exhibited as a proof of both, at our next meeting of the Board of Trustees of the Maryland Agricultural Society, at Mr. Caton's, to-morrow week. This fruit is a native of Asiawhence it was brought into Greece and Italy, but in the days of Pliny they had not succeeded in raising it-He says "It would not forget Media and Persia, and liking no other soil would soon die." Virgil says it is an antidote to poison and cure for Miscellaneous Items-Scraps from late English papersconsumption-

"With this the Medes, to lab'ring age, bequeath "New lungs, and cure the sourness of the breath."

It was cultivated in England, according to Lord Bacon, as carly as the reign of James the I.; but it is doubtful if either he or his Majesty ever saw any as large as those at Harlem.

of the BOARD OF TRUSTEES of the Maryland Agricultural Society, will be held at the residence of R. CATON, Esq. on Wednesday, the 19th inst. at 11, A. M. The List of Premiums has been prepared by the committee appointed for that purpose, and will be submitted to the Board for their revision.

DONATIONS

TO SUBSCRIBERS TO THE AMERICAN FARMER,

Deposited for distribution in the Society's Room over the Post Office, since our last:-A variety of beautiful Oats—round white Beans—and Seed of a Russian Cabbage [all gone,] which stands the winter, and grows from cuttings. Also, a model of an highly finished and ingenious instrument for pruning shrubbery, trees, &c.

PRICES OF COUNTRY PRODUCE. COLLECTED BY THE EDITOR OF THE AMERICAN FARMER.

No material difference in the prices of articles generally. As to Tobacco, the holders of the fin ; est quality are waiting expected news from Europe, and holding on for better prices-That of inferior quality, such as has been selling for \$4 or \$5, has improved about 50 cents per hundred. LIVE CATTLE—a lot of near 20 from the South Branch, brought to market by Mr. Parson's, in high order, sold, a choice lot of 11, for \$6 per head, the remainder for \$5.50; the eleven averaged about 800 lbs .- Howard-street Flour, out of the wagons, \$4.371 to \$4 50-Wharf Flour, \$4.25 -best white wheat, 83 to 85 cents-red, 80 cents, very little coming to market-best Turkeys selling in the market for from 621 to \$1-best butter in prints for table use, 311 cents.

We stop the press to announce with deep heartfelt regret, the death of MAJOR GENERAL R. G. HARPER.

Much association with him, lately, as the most active member of our Agricultural Society, had served to make us better acquainted with his personal qualities; thus uniting, to great respect for his talents and integrity as a publick man, the sincere personal regard, inspired by his courtesy, generosity, and good feelings as a gentleman.

It was but yesterday that in the Circuit Court the Editor of the American Farmer—with two he displayed the unimpaired powers of a vigo-Lemons, one of which was 13½ inches in circum-rous mind, rich in the stores of learning, acquired by the best education and the best directed industry: thus passing to the gates of death as it were in the recent footsteps of an illustrious compeer. He now lies a spiritless corpse in the house which was but yesterday the seat of elegant hospitality, and domestic happiness, a mournful illustration of the uncertainty of human life and human hap-

ly high from the beach that the bees can pass in and out all round at pleasure.—The worm owes its origin to a species of butterfly, resembling the candle-fly, probably the same. It is about the bee-house, particularly in the evening; and when the hive is set close upon the bench, deposits its eggs in small cracks under it, which in time forms a worm. It remains some time in a torpid state-then ascends the hive at night, and secures a retreat in the comb, which baffles the vigilance of the bees to dislodge it. I drew the conclusion from the slothful disposition of the worm, that it must be engendered in the immediate neighbourhood of the bees; and after trying a number of experiments, adopted the one above described, as being the most certain means of baffling all its efforts to get possession of the hive.

This last summer, my bee-house being full, I set two late swarms outside, on a bench-intending to take their honey early in the fall. The hives having no nails in them, were raised by a small block placed under one side, to let the any cracks, fill them up on the outside with a whitewash of lime.

If you consider the above information of any importance, please give it a place in your paper, and believe me to be a

BORING FOR WATER.

New-Brunswick, Jan. 5, 1825.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir,-Your favour of the 31st Dec. was duly received, by which I am given to understand that enquiries have been made respecting my new

mode of obtaining water by boring.

And, Sir, I can say, without fear of contradiction, that the principle is good, that is, the experiments which I have made have all proved successful to my full satisfaction, and to the complete I .- Description of Skates, and the manner of satisfaction of my employers-and my having undertaken and completed three wells, I feel confident that water may be obtained in most all places whatever by boring deep enough, which will be shoe. different depths in different situations. The first well that I undertook to bore I obtained water to it retards the progress, by rendering the moveflow over the surface at 140 feet, or thereabouts; ment less secure, and may occasion falls. The the second one I have bored 215 feet; the third bottoms should be of good steel, well tempered

Sporting Olio.

FOX HUNTING.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir-I am happy to see you are disposed to promote a taste for rural and field sports. Be assubees pass in and out. In the fall, when I moved red, sir, that in proportion as you can excite a them, both hives had worms under the edges relish for such amusements amongst country genthat set close to the bench; and a worm has not tlemen, and lay open such fields of entertainment for the leisure hours of the young gentlemen been seen near any of the other hives, this season, that were set in my usual way. I will here remark, as a preventive, never to put a swarm and overter cellars, and unsocial and pernicious into a hive that has been standing any time in and oyster cellars, and unsocial and pernicious the bee-house, without first pouring in boiling debaucheries of various kinds. Anxious to aid water, and rinsing it out; and if there should be you in what I believe will cheer the heart, liberalize the mind, and invigorate the constitution, I authorise you to offer to any gentleman or com-pany of gentlemen, within striking distance of Baltimore, at least one dozen of very superior hounds, if they will promise to keep them well and hunt them well—I must have an answer within two weeks.

> skater. The principal thing is to take care that Oct. 29. the skates are well made, and to fix them on in the most commodious manner. This exercise is so easy that it is scarcely necessary to prescribe any rule to young persons when they have good examples before their eyes. It suffices, by way your paper, by publishing the following account of precaution, to make them observe, that when of sporting, which I take the liberty to commuthey go alone they must lean the upper part of nicate. the body forward till they have acquired the equilibrium.

nutting them on.

When we buy skates, we should choose them yond the sole of the shoe, either before or behind, I have bored 132 feet, and the water just begins and very hard; those which are too thin and to flow over the surface.

weak, break easily, and cut too deep a track in I have contracted with John C. Vowel, Esq. of the ice, therefore we should always prefer those and have two edges. This form may be useful, because it hinders the foot from slipping when it gives will gow with as much security, and even faster than those which have others. It is essen-

slip. We must especially take care that the iron be well secured in the wood, for the most important thing in this exercise is to have the skates properly fixed. In those which are com-monly employed there are three points in the hinder part, which fasten themselves into the heel of the shoe as soon as the straps are tied and we begin to stand upon them.

II .- Elementary Exercise.

The greatest difficulty being to balance well on bases so narrow as those of skates, it will be very advantageous to teach young persons to walk with them in a room before going on the ice, and to balance themselves sometimes on one foot and sometimes on the other. These preparatory ex-ercises will soon enable them to tie on their skates themselves, which though simple in appearance, is certainly an essential preparation.-In order to prevent sprains, on first making use of skates, we should give our hand to some one near us, or hold fast by the surrounding objects, till we are sure of our equilibrium.

Thousand Guinea Match .- The great foot race for 1000 guineas, between Capt. Parker and Metcalf, the pedestrian, was run this day a little after one o'clock, on the foot path from Bennetthorpe to the Blue Bell, over the south road at Doncaster. The Captain received 40 yards at starting out of a mile. Before they had run three hundred yards, Metcalf had gained the 40 yards given, and passed the Captain, when he had it all his own way (running backwards and walking); his opponent gave in after he had run about three parts of the distance. The winner did 1080 yards in five minutes and twenty-six seconds. Several sporting men were present, and money to a very considerable amount was bet; immediately before On Skating .- The exercise in question is starting, six to four on Metcalf. The Captain learned with great facility, if we begin young and have the advantage of being instructed by a good and buff shoes; Metcalf in pink.—Doncaster,

HARES.—In a late number of his Register, Mr. Cobbett, in an article on American trees, has the following passage:-"Let me (while it is in my nead) observe, that those pretty little creatures, young trees; and that they are particularly fond of the locust, which they will bark after these get to be as big as your leg. To advise any man who has hares to destroy them, I know to be in soft water: the water did not flow over until I about three quarters of an inch. Those which had bored down 200 feet, but then it will be unare lower are good for nothing, for as scon as the derstood that it is an eminence of about 50 feet body inclines a little on one side, the skate beabove the level of the river, and low grounds in ling no longer in a perpendicular direction, the passage in Thomson's Seasons, in which the poet the neighbourhood.

L. D. wood may easily touch the ice, and occasion a calls upon "Britain's youth" not be so cruel as

to pursue the timid inoffensive hare; but to put forth their generous ardour, in order to destroy the nightly robber of the fold. What poor snivelling philosophy! Pope would not have said this. The fox, very seldom, if ever, robs the fold, and very rarely even the hen-roost. He the same mode of treatment is to be adopted.—In lives chiefly upon wild animals, and amongst these you are to count great quantities of field-mice that he destroys; whilst the hare is indeed the most timid; but, except the rabbit, certainly the most mischievous animal in existence. She will cut you off two or three hundred young trees in a night, out of mere sport. She will stand up upon her hind legs, nip off the leading shoot of a tree more than three feet from the ground,* and this out of pure mischief, for she does not eat a bit of it. I once planted some small trees in rows the foxes had done in the hen-roosts of the farm ded, moderate exercise is highly proper. in twenty years. When people write about seamen, pent up in London."

[* An American gentleman, lately from England, in himself an example and promoter of libe ral sporting, partook in that country of the pleasures of the English chase-both in fox hunting and hare hunting .- He says the English bare is as large again as ours, and thus explains, how it is that the pursuit of the English hare affords such fine sport :- It is not uncommon for an English hare to run 15 or 20 miles before they are caught-But fox hunting is altogether unlike hare hunting, having in it much more of enthusiasm and animation .- Hare hunting is pursued with harriers, and a perfect harrier will always have his nose to the ground and puzzle for an hour sooner than leave the scent, while the fox hound full of life and spirit is always dashing and trying forward.]-Edit. Am. Far.

DISEASES OF DOMESTIC ANIMALS AND THEIR CURE.

Strain of the Back Sinew - The flexor tendons. or back sinews, as they are commonly termed, tendon to the other; in violent exertions these membranes are ruptured; hence arises a greate: or less degree of inflammation, swelling, and ten effased, constituting the callous enlargement of old strains. An erroneous idea of the nature of strains very commonly prevails: it is supposed to consist in an extension of the tendon; but in dissecting an old strain, the tendon is always found in its natural state. Rest is the grand remedy for strains, and without it all others will prove iner fectual. It is by many supposed, that turning h horse to grass, when strained in the back sinews, is a better plan than keeping him in the stable; this, however, is by no means the case: at grass a horse will generally take so much exercise, as will tend rather to increase than diminish the lameness. A flamnel bandage, kept constantly wet with the following lotion, is, perhaps, as good a remedy as can be employed for recent strains; as it cannot well be moistened during the night, it is better then to leave it off, and apply it again bandage would be injurious:

Take Sulphate of zinc, four ounces; Acetate of lead, six ounces;

give some opening medicine; and if any swelling remains in the leg after the inflammation has subsided, blistering or firing is necessary, but these are never proper until that period.

first essentially necessary; blistering the pastern must have separated and made them wide apart is also proper. It should be laid down as a general rule in the treatment of strains, of whatever very close together. The hares did more mis-inflammation in the part, rest is absolutely neces-chief amongst these trees in one single night, than sary; and that, when the inflammation has subsiinflammation in the part, rest is absolutely neces-

When making the vinegar latter to their to the rest of the plants—beds of fertilizing earths, marl, &c. &c. the other to use from.

To cure the Yellow-Water in Cattle, (Horses.) -Take antimony, refined saltpetre, (that is clear and good,) flour of sulphur, cream of tartar, two ounces each, or the like proportion for a larger quantity. Give the horse, &c. as much as will lay on the point of a new case knife-(say on a ninepenny piece, or a pistareen)—three times a day, rations of men have been swept away by the hand of time; stupendous fabrics, once the proud rejects of the class of literature, the bare mention. The horse must not be used at all until some time after he is well. Mix the flour of sulphur and

A Cure for the Cancer .- We are informed that a son of Mr. Carter Harrison, of Prince-George's county, has been cured of a cancer by the appli-cation of the dock root. The dock used, in this the men were very destitute of clothing. case, we understand was the narrow leaf dock .-The root was boiled. The cancer bathed with paragraph in the newspapers, but as your jourthe decoction—(it is presumed it should be strong) lication, as a circumstance literally true, and to founded assertions.* be depended on.

To bake a Loggerhead Turtle .- Cut its throat and hang it up by its hind legs to drain; when as it is gentle.]—Edit. you think it has bled all it will, cut it up, take all the meat out of the shell and wash it in many waters till perfectly cleansed; then cut it into small pieces, put it into a pot with three pints of water, let it stew slowly till perfectly soft; then take it off the fire, and season it with pepper, salt, a small teaspoonful of mace, beaten fine, the same of cloves, a tablespoonful of anchovy liquor, or of catchup, three of Madeira wine, chop onions, parsley, thyme, sweet marjoram, winter savoury, sweet basil-(the quantity must be at the discretion of the cook or taster)—stew it among your turtle, and stir it well up, put it into your baking dish and bake it. It is a great fault to bake it livered from Taylor's Landing Warehouse, dutoo dry. Put paste around your dish, garnish with force meat balls, hen's eggs, boiled hard, or twenty-four. fried bacon.

The soup exactly the same, only instead of three pints of water, two gallons—and serve it up in a tureen. Instead of baking it in your oven, it requires so much stewing, that I generally prepare it one day to eat the next.

Brain-Staggers-A disease common to domestic animals, and to calves amongst the rest .- They are supposed, in the case of calves, to be caused, sometimes, by eating the blossoms of whortleberry bushes. In all cases brain-staggers, may, we this office. are told, be cured by splitting the skin of the forehead over the brain, and separating it from the bone sufficiently to introduce under it a small quantity of fine salt. As soon as the salt dissolves the animal is relieved.

To save Red Clover seed .- One method is to take a common grain cradle, place the lowest finger as near the scythe as you can; then fasten a piece of linen or other cloth on the backs of the lowest two fingers, stretching from one to the other. The man then cuts a swarth, taking off only the heads, with as little of the straw as possible, and lays it as he would wheat, in a straight

Cayenne Pepper-may be dried in a common dutch oven, and then ground in a common spice or pepper mill.

There is no truth in the statement, and I am antimony together; then add the saltpetre and confident that no authority from General Greene be, and he is hereby directed to furnish forthwith cream of tartar.—Proved. men on that occasion were not much in want of that the scale may be finally acted upon at the

clothing.

The action at the Eutaws was on the 8th September, 1781. In the summer and autumn of 1782 premiums will be acted upon by the Trustees,

I did not think it necessary to contradict the nal is more likely to descend to posterity, I think —and the pulp applied to it.—(Petersburg Inthat its reputation requires that you ought to be the vacancy occasioned by the lamented death telligencer.)—The same paper repeats this pubcareful not to copy from newspapers such unof General Harper; and that the Corresponding I am your ob't. serv't. JOHN E. HOWARD.

[* This reproof we acknowledge to be as just

RARE PRODUCTION.

Fat Pigs .- Three pigs, raised by Mr. Absolom Wroe, living on 7th street, in this city, (Washington) aged between 11 and 13 months old, were killed on Thursday, and the nett weight of them was found to be as follows:—No. 1, 327 lbs; No. 2, 368½ lbs; No. 3, 419 lbs. These pigs were exactly the same breed as that which obtained the premium at the Maryland Agricultural exhibition a few weeks ago.

AGRICULTURE.

REPLIES to various practical questions on Agriculture, lately propounded in the American

TO THE EDITOR OF THE AMERICAN FARMER. Frederick County, Va. Jan. 19th, 1825.

Sir,-If you think the following answers to but this is seldom done for want of time. some of the queries contained in the American before the public.

move the stock to another field, so as to give the be afraid to try on a large scale. grass time to grow a little before the rainy season comes on in May. I can assure you that this tle. I turned them on a field about the first of early grazing would destroy that noxious weed; now leave the rest for another time, or for a more accordingly I did so the next year, and I have able pen.

A VIRGINIAN. not been troubled with it since.

As to dock, briers, &c. &c. I know no way to get clear of them, except to cut them off with hoes as fast as they appear above ground, particu-

larly in the month of August. Secondly, Are permanent pastures, or the pasturing of arable land most beneficial, &c.? The answer to this question I should suppose, depends entirely upon the relative fitness of the land for grass and grain, and on its distance from market. Clover and timothy, or orchard grass, or all three together, I think are the best for pastures; for after the clover is gone the others afford excellent grazing after severe frosts, and indeed through

the winter. Thirdly, Has it been ascertained whether corn, and if any, what kinds can be advantageously cut down with the blades and tops on; and if it can, how is the process to be conducted so as to prevent injury by the shrinking of the corn, the fall-

ing of the shocks, &c ?
The kind of corn that I cultivate is white, not very flinty, and ripens usually about the middle of Sept. I believe the yellow corn ripens earlier, but it is not so good for bread-and not convenient one-half of the shocks and blades have become the ode and address for publication. yellow and dry. When this is the case there is no danger of the corn being damaged, provided the shocks be well put up and not made too large; they should contain eight or ten bushels of ears. B. Page in the chair. My plan is to plant in the old way in squares of four feet, two stalks in the hill; when the corn is

apart one way and ten the other; in this order upon R. K. Meade, Seth Mason, and Martin the shocks will yield four or five bushels of shelled Cartmell were appointed. corn. The corn that is first cut and put up should At 11 the society proceeded to the ploughing stand about a week to dry, and then the other match. A lot belonging to Mr. Robert Gray, half may be cut and put up around the shocks—east of the presbyterian church, had been sethe straighter the corn is set up the better, the lected by the committee, and six ploughs entered shocks will stand the wind and weather; the tops for competition. should be tied with bands of straw or corn stalks;

Fourthly, What is the best mode of saving siness, the vice president in the chair. Farmer of the 7th instant, worthy of insertion in clover seed, and curing clover hay? The practice your paper, and likely to be satisfactory to your with us is, to sew a piece of coarse linen on the correspondent, I request that you will do so. I two first fingers of a cradle, from the heel of the was read, and ordered to be published. have so much to learn, however, and can impart scythe to within four or five inches of the points to others so little knowledge of husbandry, that I of the fingers—with this the cradler cuts off the mously adopted—a similar one having passed at can with difficulty prevail on myself to venture heads of the clover and throws them into small the spring meeting, but inadvertently omitted in heads of the clover and throws them into shad heaps—he is followed by a boy who puts two or the list of premiums.

Resolved, That a premium of \$10 be awarded Your correspondent asks, first, What is the more of the heaps into one, where they remain a best mode of extirpating St. John's wort, dock, and running briers, or dewberries, and sassafras stacks until winter, when the seed is got out.—

Sprouts? The cheapest and most effectual mode Clover for hay should be cut when nearly one last 12 months. of killing St. John's wort that I have ever heard half the blossoms are dead, or of a dark brown of killing St. John's wort that I have ever heard half the blossoms are dead, or of a dark brown of, or seen tried, is to pasture it very early in the colour—left in the swarth till dry, then put up in spring, say from the first of March, when vegetation begins, till the first of May, and then re-up their clover green, and salt it, but this I should The reports handed in were: up their clover green, and salt it, but this I should

As to the application of manures, consisting of corn stalks, straw, &c. I think the best time to plan has succeeded very well with me. About haul it out is in the winter, to spread it on thick seven or eight years ago, being scarce of winter and plough early and deep, say seven or eight in--the grass and weeds are buried so deep that ed. Thursday, Nov. 18.

Met pursuant to adjournment-the vice president in the chair.

The committee on ploughs and ploughing matches made their report, which was ordered

The following preamble and resolutions were offered by William B. Page, and unanimously adopted.

The members of the Agricultural Society of the Valley have convened at Winchester at their annual fair, to witness the improvements and promote the interests of agriculture. They view with delight the various blessings with which peace and plenty have crowned the year. Whilst their hearts are raised in gratitude to the author of every good and perfect gift, they feel them-selves proportionably indebted to those men by whose aid they have attained liberty, without which life would lose its blessing and its charm. The arrival of Gen. La Fayette in this country, has afforded them an opportunity of discharging a small portion of this vast and countless debt. They believe that they represent the feeling, and speak the wish of their agricultural brethren in offering to him the following tribute of respect:— Resolved, That General La Fayette be elected

an honorary member of this society.

Resolved, That the members of this society

will approve any exertions which may be made by their representatives in the general and state governments, for bestowing on him such a support as will render his future life as comfortable

Resolved, That in future the reports of the tates. "The seed is not good, it is more than Then they are to be taken to a chamber or garret different committees on the subjects entrusted to a year old." After a little time many of his plants there to remain till it freezes. By no means carry not subject to the revision of the society, unless established rule.

The following resolution was offered by A. S.

Tidball, and unanimously adopted.

Resolved, That in all cases hereafter in which crops for a premium, the party applying shall accompany his statement with an affidavit or affir mation that the statement in every respect contains the truth to the best of his knowledge and belief; that he shall also have the certificate in writing, of one other disinterested person that he really believes, from the crop which he has seen, that the statement made by the applicant contains the truth, and that the committee shall not be at liberty to award a premium to any applicant, unless he be particular in describing his mode of cultivation.

The following resolutions were also offered by A. S. Tidball, and unanimously adopted:

Resolved, That the thanks of this society be presented to the vice president for the inde-pendence and impartiality with which he has presided at their different sittings, and that he be requested to accept of a silver cup, as a fur ther token of the estimation in which he is held by the members.

a silver cup be presented to the secretary for the faithful and active discharge of his arduous duties.

The society then adjourned sine die.

The following gentlemen were received as honorary members during the fair :

> JOHN M M'CARTY, of Loudoun. JOSEPH SI EER, of do. DANIEL JANNEY, of do. HUMPHREY B. POWELL, of do. LLOYD R. NOLAND, of do.

And the following gentlemen as members:

Thomas Jones, Josiah Massie, Thomas A. Tidball, Robert Gray, Joseph Arthur,

Jacob Hoffman, of Bky. Stephen M'Cormick. Thomas Cather, Henry Beatty, Alfred H. Parkins.

D0< FROM THE NEW-ENGLAND FARMER.

ON THE CULTURE OF ONIONS.

I believe that every plant has its corresponding principles in the earth and atmosphere. Were not this absolutely the case, how is it that they come to a state of perfection, each after its kind, throughout the vast variety that vegetate upon the earth? Upon the supposition that every genus are so dangerous as the wire worm, for it destroys of plants is nourished by one common principle the root and the plant perishes.

In the elements, why do they require so many

By weeding them in season two different kinds of soil and situation? Those principles, applied to one plant, have a salutary ef-fect,—to another, quite the reverse, and all this come up with the weeds. Care should be taken while from mere vegetable matter. There are not to hill then at all, rather take away the earth difference in the two experiments, we understand some peculiar plants that will not flourish, be the from the roots, as the nearer they grow to the soil ever so rich, until it becomes naturalized to surface, the fairer onions they will be. If any are their growth,-and among these the onion is remarkable.

Many good people are led to imagine that this too luxurious growth. vegetable is hard to please with a soil. They select a very nice spot of ground, and spare no pains growth, it receives no support from its top, (rein properly arranging it for the reception of the sembling corn in this particular) but rather sup-seed. "But when shall it be sown?" Some elderly people say "in the old of the moon, that the onion ripens will dry away leaving a small they may bottom well." This item is by no stem. means neglected, and the man confidently expects a reward for his punctilious exactness.— earth the onion is ripe, and ought to be pulled.— the large number of them, we took the occasion But, perhaps, not one seed in a hundred ever vege. Let them lie to the sun until the outer skin starts. to remark that with a view to weight of pork,

them by the society, be final and conclusive, and disappear without any assignable cause, and per them immediately into a cellar as the dampness haps some innocent little insect has its eyes put it appears that they have obviously violated some out with ashes, &c. What few are left standing receive all possible attention. But observe them, and you will find that not one stands upon the surface; on the contrary the stalk runs down to the depth of two or three inches of an equal bigness applications shall be made to the committee on to the fibrous roots, and this is all the perfection it for this sole purpose. Save your best onions, they arrive at in most instances. How natural and have not much regard to color, for if you the conclusion that this land never can be made to produce onions! The cultivator is determined follow that they will all be so, if you save all of not to be deceived by it again.

Now it is apparent that the want of success in the above process was not owing to a lack of vegetable substance, although it would have been an indispensable ally to those subtile secretions ripe. which were not as yet concentrated. These are gradually located by its own influence, verging to curious if they will account for the phenomenon greater and greater degrees of maturity. And which I have mentioned above, viz. that the seed for myself I am persuaded that all plants, provided they have their vital support, the longer they are cultivated in one place, the better they are; but more observably so in the one under consideration.

Some years ago I saw a piece of moist land, consisting of a rich black loam plentifully manured and sown down with onions, and the result precisely the same as that mentioned. The man, however, still persevered, and another year pro-ly. But the manuring is yearly repeated; and Resolved. That the thanks of this society, and duced him, perhaps, one onion to twenty scullions. A third year, and nearly one half were tolerably handsome, but rather large top. He can now (after a lapse of eight or nine years) rear fair onions with as much ease as potatoes.

The best time to sow the seed, like all others, is when the earth has received a goodly degree of warmth. The ground should be made as level as it possibly can be, and cleared of all incumbrances. There is little danger of making it too hard, as a pressure of the earth will have a ten dency to prevent the onion taking too much root downwards. I have no objection to sowing in hills or drills-they will grow well either way. After the seed is sown and covered to the depth of an iach, take a piece of board two feet long, fasten it to the shoe of the foot, and stamp the hills or drills perfectly level; this will press the moist earth upon the seed and cause it to vegetate surer and quicker.

After the seed is up (which is generally in a fortnight) nothing is to be done till the weeds make their appearance, unless the flies make depredations, in which case, ashes are to be sprinkled on sparingly, for in this tender state of the plant, too much alkali would prove a destroyer. Of late I find that the black ant is a foe, for it cuts the top off close to the surface. But neither

By weeding them in season two points are gain-The first is the saving of half the labour; inclined to run deep in the earth, they should be dug round, and their tops bent down to prevent a

When the onion has arrived at considerable

there to remain till it freezes. By no means carry will cause them to vegetate and the onion will soon become soft and spongy. I have kept them very well all winter in a garret, but they were not permitted to freeze and thaw alternately.

The method of rearing the seed is the following :- Select a sufficient spot in your bed and keep wish to rear, say the yellow, it will not certainly that description. Mark your bed into squares of one foot and set your onions to the depth of six or eight inches. This will prevent their long slender stalks from falling down before the seed is A CULTIVATOR.

P. S. I shall be much obliged to some of the of a yellow may produce a red onion.

Remarks by the Editor .- Onions are not an exhausting crop, but improve the land on which they are sown for several years in succession .-Dr. Deane observed, "I have many years cultivated onions on the same spot; and have never found the land at all impoverished by them. Bu: on the contrary, my crops are better than formermust not be laid far below the surface.'

NEW THRESHING MILL.

Claremont, (Vt.) Sept. 5.

On Friday last, a number of gentlemen of this town and Windsor, Vt. witnessed the operation of a threshing mill, invented by Messrs. Tylers and Andrews of this town; and the result of several experiments satisfied all present, that it would thresh and clean 15 bushels of wheat in an hour. The labour of threshing and cleaning is performed in the most perfect manner-not a kernel of wheat could be found in the heads, after passing through the mill. Every particle of dust and chaff is separated from the grain and blown away, and the straw is cut into pieces about 4 inches in length. This mill has been used with equal success, in threshing clover seed, rice, and coffee. The machine is kept in motion by two horses, and requires a driver and four men to tend it. Messrs. Tylers have been engaged for three or four years past, in perfecting their design; and while we congratulate them on their success, we hope their ingenuity and perseverance will be liberally rewarded, for having made so valuable an acquisition to the useful inventions of our country.

Since the above was in type we have learnt that Messrs Tylers and Andrews made another trial of their threshing mill, on Monday last; when they threshed and cleaned 4 bushels of wheat in 9 minutes; which is at the rate of 26 bushels and 2-3ds in an hour. The cause of this arose from a difference in the horses; one of those employed in the first instance being a bad one. Water or steam power may be applied with in-

creased advantage.

HAYFIELDS' PEN OF SWINE-compared with some in Pennsylvania and Massachusetts.

crowded coach, in a few hours of a journey .-What mischief then may not be expected, when numbers are shut up in small rooms, with an at. mosphere vitiated by their breath, and by the effects of fires and candles. The mode of admit-ting air, as practised at the Royal Infirmary at Edinburgh, which throws it to the roof, would be the best mode of preventing such mischief.

XIII. Mr. Steward likewise condemns the practice of going about all the morning, the men muffled up in spensers and great coats, and the women with furs and cloaks, whilst in the evening, they sit down to dinner imperfectly clothed, and the women half naked. Yet in that chilly state, they fill the stomach with food, having lost vital heat to digest it. Whether a life spent in the foul atmosphere of crowded rooms, or the system of chilly repletion (loading the stomach when the body is cold) does the most mischief, it is difficult

to determine.

XIV. Celsus has strongly recommended it to the healthy, to diversify their mode of life :- to be sometimes in the city, and sometimes in the country ;-sometimes at rest, but at other times to take frequent exercise; -sometimes to use the warm bath, and sometimes the cold;-to anoint sometimes, and at other times to neglect it :-- to avoid no kind of food that may be in common use; -sometimes to eat in company, and at other times to retire from it; -in short, by a varied life, to be always prepared for any circumstances that

XV. Celsus has likewise cautioned his readers. not to destroy, in the gay days of pleasure, by excesses of any kind, that vigour of constitution, which is the best support under infirmities; the loss of which, though unavoidable, yet by care and attention, may, for a time, be averted.

Domestic Economy.

FOR THE AMERICAN FARMER.

ON FLAT ROOFS. By Calvin Jones, of Wake Forest.

The object of this paper is, to state the advantages of flat roofs, and to propose a method for constructing them.

A house of three stories with a flat roof costs little more than a house of two stories with an angular roof, and an additional suite of rooms is obtained.

A flat roof may be made subservient to a thousand different uses, particularly in a town. It may serve as a promenade, as a calm retreat tion, and breathe a pure air uncontaminated by the dust and many compounded flavours of a less

elevated region.

When the yellow fever prevailed in Newburn about twenty-five years ago, Mr. Isaac Taylor infamily, and that a large one, escaped the disease, scending to the street, and going upon the roof The deleterious gases forms of disease, it is supposed, are of such gravi-XII. covered at once, the tar becomes so viscid as to impede the operation of papering that next follows. Thin fluid tar, I think better than half lows. Thin fluid tar, I think better than half make use of them, they must be near me, they made use of newspapers. I found on trial that it the others could not nourish."

Thus we perceive that agriculture, manufactures and advantage. These I lapped together, tures and commerce are dependent on each other tone at a time) in a single fold and dipped into a cer, that when one is injured the other must be kettle of warm tar. They were laid, overlaping each other about an inch, and spread and doctrine inculcated by some, that Europeans sily distinguished by the fever which attends it, and spread and countries to the course fever which attends it, and spread and countries to the course fever which attends it, and spread and countries to the course fever which attends it, and spread and course fever which attends it. pressed with both the hands. If a ridge of tar, ought to be our producers for every thing belonging the pain the animal suffers, standing with his as was frequently the case, collected in one spot, in growing to the second class, and for much of the first, it was pursued by hard pressure until it escaped and that America should depend for her resourant the margin. The tar gave such cohesion to the paper as to allow it to be strongly handled. That the opinions by which we have been led amining the bladder; and upon extensive the paper as to allow it to be strongly handled. That the opinions by which we have been led amining the bladders of such horses after death, ware of European origin will not be depleted. the paper as to allow it to be strongly handled without the danger of tearing. I gave the roof three coats of paper, and then sifted over it through a fine seive, a quantity of pure sand. In a few days it was as hard as stone, and no tar was emitted through the seems after the paper was applied, though both tar and water had percolated before. For nearly four years the roof was without defect. A crack then appeared in one place which was stopped by the application of tar,

and perhaps some confirmation of this opinion ly given. I found some nicety required in fitting vailed in our commercial cities; but Europeans In that cave, dogs, holding their heads near the the paper round some posts at the end of the have reckoned without their host; they have defloor, and respiring a ponderous carbonic acid roof, but the whole manuel of the business was ceived themselves, as the late fair in this city gas, are instantly deprived of sensation, while performed by a negro of moderate intelligence. amply proves. They have yet to learn the exmen, standing erect, and breathing a higher and Short boards were placed for the workman to tent of talent and enterprise that a nation of freeless contaminated atmosphere, are not affected.

I have examined several flat roofs, and have ed the paper. The plan of the parapet, which seen but two that were properly constructed a roof of this kind requires, is submitted to the many of the first rate European manufacturers

The scene of action was an extensive turnip-!

field, in which it was known partridges abounded. As soon as Col. Thornhill, (the proprietor of the hawks,) Sir Francis Burdett, Sir Hussey Vivian, and others, his companions, had arrived, and the spectators had been ranged outside the field, a hawk was taken from the perch, unhood. ed, and permitted to fly. It immediately towered, and hovered over the field, and, by and by, so that you might almost have fancied it an airy pointer, he seemed to beat backwards and forwards, quartering his ground, as it were, in evolutions similar to those used by the staunch quadruped. A partridge was, at length, put up; it was immediately pounced upon, and struck to the earth; but the blow was not fatal, it again rose, and fluttered, as if for protection from man, into the midst of the company. Even here it was followed by its eager enemy, and on its again attempting to rise in air, for life and liberty, was, "at one fell swoop," annihilated. This hawk was then taken from the prey, and another sent abroad on its flight of destruction. This was a young bird that had rarely been tried before, and, immediately it found itself at liberty, it darted, like a lightning-flash, and was quickly at a dis-Yes, my good friends, I have almost fancied tance from us; and I should think it fled for con coursed the airy quarry, the down was peo-Since the demise of the Duke of Queensbury, pled with horsemen, who, at their topmost speed,

To the Editor of the Annals of Sporting. Sir,-Will you or one of your correspondents

en relieved for a time by diuretics; at length eruptions appear on different parts of the body, and when a total suppression takes place, from the structure of the kidneys being so destroyed that they can no longer secrete any urine, the animal soon dies. In such cases the bladder does not appear to sympathize with the kidneys, as in acute inflammation of those organs; for the horse is not constantly endeavouring to stale. Gibson relates a case of decayed kidneys in a miller's horse, caused by carrying heavy burthens. 'This horse,' he says 'was often subject to suppression of urine, and though he was always relieved by timely applications, yet these became more frequent as he grew old, till the last attack, when he continued three days before he died without staling or showing the least disposition to stale; during which time he never stood wide and straddling, but moved his hind legs and would cross them with great ease, till the next day, when A DAY'S HAWKING IN THE COUNTRY his legs and whole body swelled and broke out all over in moist watery blotches. After death the kidneys were examined; nothing remained of the right kidney but a small hard substance about the size of a pullet's egg, almost ossified, and of no regular shape. The left kidney was extremeing lost its power of contracting. When the baffled the genius and inquiries of the scholar and monument of the brown desert. AGRICULTURE.

From an unpublished volume of Agricultural Memoirs.

ON THE CULTIVATION OF RUTA BAGA AS A SECOND CROP;

With an estimate of its comparative value for feeding stock: By J. Buel, of Albany.

Having for several years grown the common white turnip with uniform success, on ground where the same season I had cut wheat, barley, rye, &c. I was induced, in 1822, to hazard the experiment, then to me a novel one, of raising the Swedish turnip after clover. My success in that and the two subsequent years, has fully confirmed me, not only in the practicability, but in the economy of the practice. The result of my first experiment will be found in the Memoirs of the Board, vol. ii, p. 250

The second experiment was upon a lay, partly of lucerne, too thin to be worth preserving, and partly of clover. The first was cut twice for green food, and the latter once for hay. The ground having been manured, was ploughed and harrowed, and the seed drilled in, at the distance of three feet, between the rows, the 28th June .-The crop was cleaned, thinned and hoed in the usual way; and the product was between five and six hundred bushels, or about sixteen tons, on the acre.

Encouraged by this success, I this year put in two and a half acres. Being short of pasture, I fed off the clover in June, instead of cutting it for hay; manured, ploughed and harrowed the ground. A man was employed half a day in put-ting in the seed with a drill-barrow. The crop was betwen 13 and 1400 bushels. Some of the roots weighed between 15 and 16 lbs. each. The tops, nearly equal in bulk to an ordinary crop of grass, were fed to my cows in November and December, with great benefit to their milk as well

Messrs. I. & J. Townsend, who cultivate a farm adjoining me, have raised ruta baga the three last seasons, the last of which was upon a clover lay, where the grass had been mown for hay. They have used their crops in fattening bullocks, with

as flesh. The roots were pitted in the field.

The following is a fair estimate of the expense

of cutervating my crop the current year.	
21 days ploughing, man and team, . \$2 5	0
1 day harrowing, 1 (00

50 loads manure, and spreading, . 26 5	0
The second secon	_

Total expense, . . . \$34 62 Or, \$13.34 the acre. This is allowing the whole expense of the manure, though not more than a third or a half should be charged to the crop .-Assuming as a fact that the product was 1400 tops more than compensated for the after-feed.-

VOL. 6.-46.

man in the same way that a wheelbarrow is; and to the early mown fields. it requires the same time to drill in and cover the ed the cultivator, which cuts 22 inches, destroys the weeds and mellows the soil between the rows. The thinning and weeding are performed by turand a half wide, and eight inches long; their ex-In harvesting, pits are made at convenient distantured. ces, five or six feet square, and eight or ten inches, only, deep. The roots are drawn up with the account will stand thus:a potato-hook, and thrown to the edges of the pit, where a boy seizes them by the tails, and, with a large knife, strikes off the top at a blow, and throws them into the pit. They are raised in a pile two or three feet above the surface, and brought to a point, slightly covered with straw and two or three inches of earth. *

It remains to be shown, that the crop thus produced is really worth what it has cost; to wit, two and a half cents the bushel, or thirty-four dollars sixty two cents in the gross. I can perhaps best demonstrate this, by stating the uses to which it is to be applied, and the manner of consuming it. As my farm is small, it is of importance that every acre should be appropriated to the most had the opportunity of appreciating the value of profitable use. I keep seven good cows, and a yoke of oxen. To render them profitable, it is not find that I have erred in its favour. I have necessary they should be well kept. With small enclosures, a good selection of grasses, and frequent shiftings, a cow may do tolerable well with an acre of pasture; but in a single enclosure of ordinary pasturage, two, and sometimes three acres to each cow are found necessary to render the dairy productive. Assuming what I conceive to be a fair medium, I should then require eighthe first of August; and about six tons of hay (allowing each animal to consume 24 lbs. per diem, or a ton in three months) to keep them through the months of March and April. Now, these eighteen acres of pasture converted into mowing ground, estimating the product at two tons per acres, (and I would not commute at less than three tons,) would give 36 tons of hay.—The fair average price of this is \$10 the ton. Deduct \$4 the ton for curing and marketing, and it leaves a clear profit of \$6 the ton, or \$216 on the whole eighteen acres, which I propose to convert from pasture to meadow. Now if I can keep my stock, and keep it well, without the aid of these eighteen acres, my gain will be the difference bethe actual expense of the food on which it sub sists. This brings me to the first point suggest ed-the uses to which the turnips are to be applied.

the labour, I will state my mode of culture some- tinued 20 days in May, till lucerne is fit to cut.what in detail. The ground being a sand or sand The 1400 bushels ruta baga will, at this rate, feed loam, requires but one ploughing for any crop, nine head of cattle till the first of August. But and is soon pulverized by the harrow. This work as they may not keep later than the 10th or 15th was therefore done in less time than is stated in the estimate. The drill-barrow is propelled by a resort will be had to clover, if the lucerne fails, or

While the ground remains frozen, with a pickseed, that it would to furrow the ground for corn. ax or grubbing hoe, an opening may be easily made The seed being sown in drills, an implement call-into a pit. The whole of the roots are taken out of it, put in the barn, and covered with straw .-They are fed without being cut, in the yards—they being kept well littered—or in the stables. nip-hoes, the blades of which are about an inch When the ground has thawed, they are placed in and a half wide, and eight inches long; their ex-tremities being rounded, turned up and united, And in April and May, the roots are all taken form a shank for the handle. With one of these, from the pits, and spread on the floors of the a man walks between the rows, and draws it through the strip left untouched by the cultivator, after the 15th or 20th May. This grass will bear leaving the plants standing only at intervals of cutting three times, at intervals of 30 to 35 days; nine to twelve inches. After a little practice, a and as I have an acre of it in excellent order, I labourer will thin half an acre a day. I have esthink it will afford me a continued supply, until timated one fourth of an acre as a day's work.— my meadows and grain fields are ready to be pas-

According to the data which I have assumed,

Profit on 18 acres in meadow, \$216 00 rom which we are to deduct,

Expense of 1400 bushels ruta

. \$34 62 baga, . . Value of an acre of lucerne, say, 20 00-54 621

Difference or gain,

I have made no account for feeding the roots and lucerne, as I think the manure, the value of which is not generally appreciated, will afford an ample remuneration.

The preceding result, I am aware, will, by many, be deemed altogether visionary. I confess it is calculated to surprise those who have never not find that I have erred in its favour. I have cultivated the ruta baga six years, and my opinion of its value has continued to increase. It is not only valuable for neat cattle, but, when boiled or steamed, for horses and swine; and there is nothing superior to it for sheep. It is also in the spring a fine vegetable for the table. It has been a sure crop with me; bears much frost without injury; does not become pithy, and may be kept as fate teen acres of pasture to keep my nine cattle till in the summer as the potato. Yet it is generally getting out of credit, from the circumstance of few persons having been successful in their attempts to cultivate it. If sown on a light soil, well manured, cleaned and thinned when the plants are small, and the ground kept well stirred, it cannot fail to remunerate the cultivator.

PROPER TIME FOR SEEDING WHEAT TO PREVENT FLY.

TO THE EDITOR OF THE AMERICAN FARMER. Frederick County, Md. Jan. 4. 1825.

Sir,-In looking over the contents of the thirtytween the profit on 36 tons of hay, or \$216, and ninth number of the sixth volume of the American Farmer, I noticed the different result experienced by two respectable gentlemen in prepar-ing their seed wheat, and what the effect and be-I propose to feed them at the rate of one bushel nefit was that they found from it. As it appears bushels, the expense falls short of two and a half per day to each animal, commencing the first of Mr. Birnie was disappointed—the steep and lime cents the bushel. I make no charge for the ground, March. As 60 lbs. of roots will be far better for had not the desired effect to prevent the fly from because it had given its crop of clover; and the a cow or an ox, at that season, than 12 lbs. of hay, injuring his wheat. Mr. Buel is satisfied by exthe quantity of hay fed to them may be diminish- perience, that the preparation he applied to his Besides, it is greatly enriched, and made clean, ed one half after that time. This will make a seed wheat had the desired effect in his crop, but and in fine order for a barley crop, by the manure saving of three tons of hay in March and April. Cannot account why it had not the same good efand turnips.

This saving, which will be equal to \$30, I will feet with Mr. Birnie. Being satisfied that these That I may not be charged with underrating take no account of, as the feeding may be con-two gentlemen have given the result of their experience to the public for the benefit of others, which is so laudable in them, and should be done by every farmer, I will now give my opinion wherein Mr. Birnie mismanaged in seeding, and thereby had the heavy loss in his crop. By at least fifteen years of experience I have found seed wheat, prepared as Mr. Buel states he does, and sowed between the 20th and the 29th of September, the fly did never destroy, nor even hurt to be complained of. To sow later than this in our district of country (without the land is very strong) the fly will take it in the month of May, the young crop in the autumn, and injure it also; therefore, I have found it is necessary to observe any part of the work to raise a crop of wheat. It is immaterial that I differ with the gentlemen in what way the fly is propagated-to find out the proper time for seeding is of much more conse-A Frederick County Farmer.

SOME REMARKS ON THE CULTURE OF LUCERNE.

TO THE EDITOR OF THE AMERICAN FARMER.

Sir,—In your 5th vol. page 214, is an article on lucerne, taken from the New-Brunswick Times.

I have read in some newspaper the remarks of the New-Jersey Farmer, and observed that you had omitted a part which I think material, and therefore endeavour to supply the omission as

well as I can from memory.

The New-Jersey farmer recommended sowing about half a bushel of spring barley, or spring rye, with fifteen to twenty pounds of lucerne tion of some of the most experienced manufacseed to the acre; and if spring rye could not be turers in Massachusetts, and they have been regot, to use winter rye. Last spring I sowed one cently returned to us with a letter, from which acre with a half bushel of spring barley and 16 we make the following extract: "I enclose a letpounds of lucerne seed, and another acre with the ter addressed to me on the subject from P. T. same quantity of seed and a halt bushel of win-ter rye. The object in sowing grain is to serve as a nurse to the young grass against the heat of the not a little of its celebrity. scorching sun. The barley quickly grew up so as to protect the young grass, and being thin did timated, when it is known that the supply of the not smother it. The rye being thin, branched out, raw material has been under his superintendance and for some time did not shoot up like the barlev. The grain of the barley was heavy and fine, and the produce was full half a crop; the rye produced no grain. I directed the barley to be mown high, in order that the young grass might be injured as little as possible. The lucerne on both acres was mown about the last of August; by the last of September it was knee high, and roots, and prevent the grass putting up so vigorously in the spring.

It may be proper to remark, that the early part

of last summer was seasonable.

In order to have the quantity of seed regularly sown. I directed that each acre should be divided into eight equal parts, and two pounds of seed sown on each part, so that it might readily be ascertained whether too much or too little seed was used. The sooner it is sown in the spring the better, provided the ground is dry and in good order. The ground ought to be good, and well cultivated the preceding year in potatoes, or some other crop, to destroy weeds, as weeds are very injurious to the young plant.

It is important to procure good seed; Robert Sinclair last spring had some very fine, which he sold at a half dollar a pound. In order to be certain of good seed, I have for two years imported it from Liverpool, where it was procured for me by Messrs. Wm. & James Brown. The cost, charges, and duty, amounted to nearly fifty cents a pound. J. E. HOWARD.

January 31st, 1825.

FLORIDA COTTON.

In our last number, mention was made of some beautiful samples of Cotton, transmitted from Florida by Captain Burch, of the Quarter Master's Department, through the hands of the Secretary at War, who is amongst the most accomplished practical planters, and enlightened promoters of the interests of Agriculture in our country-His letter follows :-

Washington, Nov. 25th, 1824.

Dear Sir,-I enclose herewith four samples of cream colour. and destroy it; sow it earlier the sy will get in Cotton raised in Florida, which has been transmitted to the Department by Captain Burch, of the Quarter-Master's Department. Believing the right time for seeding, and even more so than that I could not better dispose of them than by placing them in your hands, where the mechanics and manufacturers may see and judge of their quality, I have a real pleasure in transmitting them to you for that purpose.

With great regard and esteem,

I am, dear Sir,

Your most obedient servant, J. C. CALHOUN.

JOHN S. SKINNER, Esq., Baltimore.

The samples were of Cotton cultivated by John Garnier, Esq. of Santa Rosa Sound, and were accompanied with the following memoranda:-

No. 1, from Sea-Island seed.

No. 2, from Mississippi and Mexican seed.

No. 3, from Mexican or white seed.

No. 4, from Mississippi seed.

They were all sent to our friend S. W. Pomeroy, to be subjected by him, to the examina-

The remarks of this gentleman will be duly es-

since its first establishment."

Mr. Jackson's Letter to Mr. Pomeroy.

Dear Sir,-I have examined the cotton you handed me, and have made some short remarks on each sample. It is very difficult to judge of the quality by such samples. I can say, generally, that I think them very good; and that cotton my overseer wanted to mow it again, but I forbid of like qualities would bring in this market high him, thinking it would check the growth of the prices. I do not so much like Nos. 1 and 2, but would like to purchase of Nos. 3 and 4, 50 to 100 bales of each kind on trial, and, perhaps, half as much of Nos. 1 and 2. I shall want of cotton like Nos. 3 and 4, about 2000 bales next year, and if the gentlemen who forwarded this can send to contract for part, at least, of my next year's supply.

Your obedient servant, P. T. JACKSON.

Boston, Jan. 15, 1825.

Remarks on No. 1, from Sea-Island seed, by an answer marked A. agent for several factories: Nearly equal to best Sea-Island. If sown near salt water it would be ers and manufacturers of hemp, and answers reequal.

Remarks of P. T. Jackson: Very clean, but not to 5 are taken. so good a staple, nor is it so soft and silky as good

Sea-Island.

Remarks on No. 2, from Mississippi and Mexican seed, by an agent for several factories: Very good, equal to fair quality Sea-Island.

so long or strong as Sea-Island.

Remarks on No. 3, from Mexican or white seed. by an agent for several factories: Similar to the best New-Orleans, but not so strong, though

equally fine.

By T. P. Jackson: Very soft and silky and

clean, but not very strong.

No. 4, remarks by an agent for several factories : Equal to the best New-Orleans, or any short staple cotton in the world.

By P. T. Jackson: Very soft and fine, and clean. For the use of Waltham Manufactory, we prefer

Rema: ks by a merchant who has long been an importer and dealer, and is considered one of the best judges, of that class, in Boston: On No. 1. degenerated much in staple from the Georgia Sea-Island, but better than prime New-Orleans. On No. 2, superior to the Mexican or white seed in length and fineness of staple. On No. 3, rather finer, and better staple than Georgia Upland; considered of same value. On No. 4, equal to prime New Orleans.

Thus we have given the result of the examination of a valuable commodity, to the growth of which it seems this newly acquired and rich territory is well adapted. But after all the only cue to the remarks in the hands of the reader, consists in the designation of the seed from which the samples were produced. To appreciate the information, and to draw practical deductions from it most effectually, it is also necessary, we are aware, to have a view of the samples; we shall deposit them, with this paper, in the room of the Committee on Agriculture at Washington as usual, together with the surplus of grains, grasses, flower seed, &c. which have reached our hands for distribution since the last session of Congress, chiefly from publick spirited Officers of the Navy.

REPORT OF THE SECRETARY OF THE NAVY.

We have pleasure in laying before our readers the following interesting report of the Secretary of the Navy-It throws valuable light on a subject in which the landed interest is much concerned, and which, if they take due advantage of it, will avail them to great profit-especially the western portion of the United States .- Edit.

> NAVY DEPARTMENT, January 5th, 1825. 5

Sir,-In answer to the resolution of the Senate of the United States, of the 17th May last, "That the President of the United States be requested to cause a report from the Secretary of the Navy to be laid before the Senate, at the commencement of the next session of Congress, showing the reasons, if any, why canvass, cables, and cordage, made of hemp, the growth of the me 100 bales this season on trial, I might be able United States, may not be used in the equipment of national vessels, with equal advantage as if of foreign fabric or materials," I have the honor to present to you the following report :-

The resolution was communicated to the Board of Navy Commissioners, who have furnished the

A variety of questions were proposed to growceived, from which the extracts marked No. 1

From these and other sources of information. the following conclusions are drawn.

1st. That hemp may be cultivated in the Unit-

ed States to any extent which our necessities may require.

By P. T. Jackson: Very soft and clean; fine 2d. That, in the present mode of cultivation, fibre; longer staple than New-Orleans; but not there are some errors, which may readily be 2d. That, in the present mode of cultivation, corrected when more attention is paid to it.

BOTTS IN HORSES.

TO THE EDITOR OF THE AMERICAN FARMER, Talery, (Oneida Co. N. Y.) Jan. 18, 1825.

Dear Sir,-I consider the proof of suggestions aumission, shall pay into the I reasury the sum of ten dollars, and shall be subject to a contribution of your correspondents, important to be detailed in your valuable paper. Looking over your work, first meeting in Lanuary, April, July, and October.

See a dollars a year, payable quarterly, on the first meeting in Lanuary, April, July, and October.

Page 214, met way 200 and I consider the proof of suggestions of your correspondents, important to be detailed my vinegar casks; the next summer I succeeded again in the same manner. 2. Such additional funds as may be required by the exigencies of the Academy, shall be raised by an equal levy on each of the Resident Memanimal.

The last summer a mare was so violently atentitled to a vote, or eligible to any office, until tacked during my absence from home, that her such arrears shall have been paid; and if any Member shall neglect or refuse to liquidate his wife (after my two teamsters and others had exhausted their knowledge,) to get in some other of, his name shall be erased from the list of Mem- person as a salvo to their own credit; she in due form assumed perfect knowledge of the disease, although previously never having heard of it, remer, and administered according to Mr. Owings:

Your's respectfully,

N. B. We have a remarkable fine and open season, such as has not been experienced for a long

-0-ON MAKING ICE-HOUSES-& VINEGAR. FROM A CORRESPONDENT.

In answer to your query about Ice-Houses, in the Farmer of the 7th:—Line your house with 1. The President may appoint Members, from stone, because it is almost as cheap as wood, and will last an age. Let your house be dug circular,

considered as a pledge of conformity to its con- of the branches of Natural Science, or Literature, in, and as it settles will bind the wall firmer—a stitution, laws, and regulations.

| may be appointed by the Society; and such lec- dry wall will do. Ice will recede or melt in the provided it is well done: loose, waste straw is better than bundles, and wheat than rye straw .-Keep the top of your ice always well covered af-

> In the Farmer of the 21st, to make Vinegar :approve of it. In the first place, of what use is 2. All Members shall have free access to the the bottle in the bung hole unless set in the sun? Museum, and the books subject to the regulation which I suppose is intended; the strength of the liquor evaporates through the vacancy between 3. All donations of books shall have the names the bung-hole and neck of the bottle; the liquor the donors affixed thereto. 4. All donations in Natural History shall have weather—the staves are opened by the sun and the names of the donors and the localities affixed air, and the hoops burst. I will venture to say, that of the vinegar made so a third is lost.

> To make good vinegar fill your casks with ciat the option of the depositor, giving the Libra- der, into which no water is put, bung them up with a long bung, with a rag wrapped around it to make it tight-a long bung that you may pull it out without much trouble: set your casks in a 1. The order of business at the meetings of the ociety, shall be as follows:—
>
> 1. The minutes of the preceding meeting read, shingles—let your casks be raised so that you and the sense of the Members taken thereon can examine them easily when you please, which 2. Names of visiters announced by the Presi- ought to be once a fortnight, for even here the casks are subject to leak, the hoops to fly, and the liquor to evaporate; and keep them always full: -it is well to have three, one of the best out of which you may draw into bottles; the second to fill the first with; the third, waste cider to fill up the second with.

I tried this: twenty years ago a gentleman told me to put a peck of bran in, or six or eight sheets of coarse writing paper; I put the bran into one, the paper into the other-both answered well -My vinegar is so strong that my family puts water to it to make pickles. When once you have a course of casks, you may keep it up always by using from the first and filling up. I am confident with care, six or eight barrels might be made so every summer with the three barrels, only be careful not to use watered cider.

Agricultural Correspondence.

Extract to the Editor, dated Burlington, 27th Jan. 1825—RUTA—CABBAGE, &c.

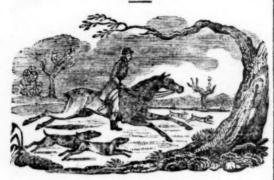

"The experience of the last summer has satisfied me that my doubts, formerly communicated to you respecting the Ruta Baga, were well founded. I tried them under the most favourable circumstances of soil, well digested manure and good cultivation—the season was rather wet—the paired to my "Vade Mecum," the American Far- Champion, and part saved from the central stalks in my own garden-they looked beautifully-free from the cabbage-like tops; still the produce did not exceed two hundred bushels per acre. My cabbage crop was excellent, and has been highly beneficial as food for my stock-I am still feed-ing them with advantage. Taken up and laid on corn stalks, with the heads down and covered with the same article, they are completely protected from the frost. My hogs have thrived on them better than on pompions. I fed my fatting hogs with them mixed with corn, till within a fortnight of killing time."

M. Appert proposes to publish a journal of the y in their rooms.

wider at top than bottom, say sixteen feet at top, prisons, hospitals, primary schools, and benevo2. Lecturers to deliver public courses on any thirteen at bottom; a circular wall will not cave lent institutions in Paris.

As it was obvious that crops June. The scheme may therefore be considered could not be gathered in before that time, it was at an end, until better digested and revived.

Extract from the Proceedings.

At a sitting of this institution, held at their. rooms on Saturday evening, the 29th January, a paper was read by Mr. P. T. Tyson, one of the members, on the sources of natural springs, and the practice of obtaining water by boring into the earth*-Ordered that the said paper be printed in the valuable journal edited by Mr. Skinner.

The Academy was presented with a very hand-some specimen of the Native Solanum Tuberosum (Potato) in full flower with the tubes-This beautiful specimen of the indigenous potato, was found upon the Island of San Lorenzo, on the coast of Peru, September the 18th, 1824, and transmitted to the academy by Commodore Hull, through Mr. Skinner.

Two very beautiful shells, (Buccinium,) and a box, containing a great variety of specimens of insects from Germany, were presented of their own accord to the Academy, by Masters, Frederick G. acknowledging these donations as an evidence, that their labours will stimulate the youth of To Correspondents .- A Constant Rea. America, to the cultivation of Natural Science;

d Vinenceof the reland m the d LiteJohn Adlum, Esq.— Sir,—My brother, Major Hugh M'Call, of Savannah, has favoured me with your letter to him, nothing acetous. dated 23d January ult. it gives me some useful

ture: in my dressing the vine, I follow Speechley. books for red wine, without the addition of sugar:

I have been long satisfied of the vast importance it ran quickly into the acetous stage of fermentato our country, that would be the cultivation of tion; and, in dudgeon, I threw it away. the vine: with all my preaching, however, from for my endeavours in giving them, or rather en-Brandy, to the most delicious Wine,-poisons to sanatives,-the liquid fire of the author of mis-

chief, to the beverage of the gods. brought to Georgia by Henry Hunt, Esq. a kins-Columbia county, from thence it was planted in it will be ripe: manage as before. Warren county, and is called the Warrenton I have noted no method of fining grape, but I call it the Hunt grape: the Hon. Mr. Pierré, except the following:— Milledge thought it indigenous, until I informed him otherwise. Several years ago, the Secretary letter remains unanswered. Recollecting a conversation I had, nearly forty years ago, with Mons. Estave, a French Vigneron, who came to

the wine was vapid, and tart, like Rhenish wine; its greatest quantity of tartar:-As the grape and now, it tastes like vapid hock; and, although progresses to ripeness, the saccharine is secreted,

dated 23d January ult. it gives me some useful hints, on the subject, of which I have been in purbints, on the subject have been in purbints, and the suit for eight years.

My friend Mr. Thomas Chase, of Annapolis, and were injured by mildew and thrips: I collect-therefore I conclude, that to add the fruit dried, and were injured by mildew and thrips: I collect-therefore I conclude, that to add the fruit dried, Maryland, was the first to stick a vine twig in my ed what remained, pressed on the foot-stalks, or partially so, would be a preferable practice, to head, and gave me some information on the cul- and fermented after the manner recommended in that of boiling the must.

not look eight or ten years ahead for a large com- and are rather calculated to mislead, than to inpound interest for their labour; they must have struct. A friend, in Charleston, sent to me a the simple interest, great or small, for use, at the book, written by L. de St. Pierré, who was a pracent of the year, or they will not touch;—they call me a visionary, and other names, as a reward volume contains much that may be useful to us, but is out of print, -I have made copious extracts deavouring to give to them, a new and invaluable from it. He says, never take off the berries of the staple: their taste, too, is vicious; they prefer grapes, from the foot stalks, before washing them. Auguadente, Whiskey, and more executable Peach If red wine is intended, let the mashed grapes readded to the must to obtain due strength in the of usual heat and dryness, would give to the wine density or specific gravity were sufficient; but I have been at much trouble and expense, in a husky taste; if the weather is warm, the time until that point should be ascertained, to add collecting and cultivating vines of foreign counin the vat should be less,—if the weather is coldbrandy in a known quantity, to give a fashionable
tries, to the extent of fifteen or more, varieties,
er, the time is lengthened,—if cold and wet, the tries, to the extent of fifteen or more, varieties, or half an acre of ground; and have, on trial, cut time in the vat, may be a whole night. If Champaigne wine is intended, it must be pressed, as increase the sugar, and diminish the added branday above one-half,—their fruit uniformly rotting paigne wine is intended, it must be pressed, as increase the sugar, and diminish the added branday as washed, to prevent its taking colour.—dy, until I could dismiss the brandy to the grogtained but three kinds for the table; and two that When the fermentation subsides, tighten the bruiser, and retain the pure wine for the wise, makes wine, neither of which Mr. Chase suppos- bungs as soon as it can be done with safety to the the witty, and such as are wont to set the table ed, would make good wine;—one is called the cask. Bottle Champaigne between the 10th and in a roar.

Madeira, for no reason but its colour,—its bunch
14th of the March moon, through a syphon,—

The Hy es weigh four ounces—berries the size of a mus-ket bullet, with a pulp, juice pleasant, but pulp quite tart,—the taste is somewhat astringent at full ripeness-this I call No. 1-the other grape and in six weeks the wine will mantle and froth: first mentioned, are mere quackery: they answer has long bunches, small dark purple berry, whitish if the wine is removed to a distance, especially in but a single purpose. Beaume's sinks to zero in juice, which is pleasant, little pulp, and bunches summer, it must remain a month at rest to reabout 4 ounces, which I call No. 2. It is a grape cover its briskness. But, it is a better practice, gr. 1.200. cover its briskness. But, it is a better practice, gr. 1.200. to let the wine remain in cask, and bottle it beman of the Earl of Shellburne, before the revolu-tion, and planted in, then St. Paul's Parish, now, the wine will have lost its verdure and sweetness—

of the Treasury, issued a prospectus, that use measure, to a muid of 230 pints, when the wine ful things could be had from foreign countries, has not turned yellow, to any great degree; but measure, to a muid of 230 pints, when the wine Filled two demijohns. Sept. 14, racked off the has not turned yellow, to any great degree; but wine from the lees—fusnigated with sulphur; through our Consuls; and supposing that what if it is much yellowed, put at least four pints to a and at several times added 10 per cent. of French was wanted, would not be understood without be muid; then stir it well with a stick cleft in four, brandy, of common sale proof; vessels not full, ing applied for, I wrote to him for the vine: my and add four or five handfulls of clean dry sand, bunged close. Nov. 18, racked again: there was

the native vines of any country, preferably to assigned strength. Some have said boil the must, raisins, and compared it with a good wine of Siexotics: this recollection induced me, the last when it is too watery and poor,—this is quite cilly,—mine was drier and preferable. April 3d, spring, to take into culture one of our native grapes, with long slender bunches, small berry of a dark blue colour, with redish juice; such of these as were grafted partly grew, but the slips placed in the ground, in the usual manner all led: this year I intend to take up, and graft a number of these, and will call them No. 3. They is generated,—for, when in balance, they both

Vol. 6.—47.

are the blue summer grape of our river low change into spirit, which is not alcohol, but pregrounds: I intend likewise to graft some of the pared for separation from its placenta by inter-

grounds: I intend likewise to grait some of the pareo for separation from its placenta by interindigenous Muscadine, and two kinds of Fox mixture with caloric, with which it bears a great-grape,—one a dingy red; the other a dark purer affinity, than the other component parts of ple, or, indeed, black, with blue bloom, and of wine.

In the wine was in ing conjectures: The grape, in its green stage, 1816, from a single vine No. 1; I pressed the when it begins to blush toward ripeness, has little wine was vanid and tart like Rhenish wine: its greatest quantity of tartar:—As the grape. it has been some years in an ullage bottle, it has from the tartar, and other principles, contained nothing acetous.

on; and, in dudgeon, I threw it away.

I had read all the books, on wine subjects that kept for the initiated into the wine-schools, of such a text, I have not, in Georgia, made a single I could obtain; but it seems to appear, that the the several European countries: unwilling to be convert to the faith. The people of Georgia, do writers understood but a little of their subject, foiled, I progressed under the following general propositions:-

To make the best wine from any grape, there should be a balance of elementary principles in

That such principles, in proper quantity, to be ascertained; and it being agreed, by all Amerimain in the vat four or five hours, to obtain the wine, I concluded to make the addition, under the required colour, a longer time, if the weather is correction of the Hydrometer, to know when the

The Hydrometer of Fahrenheit, or that of A

In 1820, the season was wet. The grapes No. 1 tween the 10th and 14th of the August moon, and did not ripen well,—all my others rotted. Auther wine will have lost its verdure and sweetness—it will be ripe: manage as before.

I have noted no method of fining wine, from St. gallons of juice: Hydrometer in the must 6½ departments. Pierré, except the following:—

To sweeten harsh or green Wines.—Take sweet raised the Hydrometer to 101 degrees. Therways milk, skimmed, and pour two pints, Paris rometer in the shade 89°, and in the must 83°. much lees, which lessened the quantity in the vessels. Dec 23d, racked again, and added to a Mons. Estave, a French Vigneron, who came to Georgia, intending to cultivate vines, amongst other things he observed that he would cultivate the native vines of any country, preferably to assigned about the density, or specific gravity of the must directed by L. de St. Pierré to make Spanish wine. March 13th, tasted the wine without the

grapes—seven bushel baskets of No. 1 and half grees (sp. gr. 1.118)—turned into a keg and 10 gallon of berries of No. 2. My other grapes all bottles. This wine has been racked and sulphurrotted: mashed, and pressed off 164 gallons of ed twice;—a little of it which bottled is, I think, juice: Hydrometer in must rose to 8 degrees—the most perfectly delicious wine that I ever added 14 lbs. brown sugar, when the Hydrome- tasted; colour rather lighter than Madeira, but 85°, and in the must 76 degrees: turned it in a time, it will shew that to make the very finest cent. of French brandy,-wine tastes Rhenish .-Oct. 18th, compared the taste, with that of last henceforth,—perhaps I may raise the must to nion, that the Muscadine will make a good wine year,—the Fabrique seems improved. I discorather more than 16 degrees, or to specific gravivered that a bottle of last year's wine, which had ty of 1.125, say 121 per cent. heavier than rain strongest. In round numbers the must will stand lees in it, was much more improved, than that water. There has been neither brandy nor old as follows, viz: quality.

1822 .- Season wet. August 8th, collected 81 thrips and mildew. bushel baskets No. 1, and 11 baskets of No. 2in all 194 baskets-picked off rotten and unripe 8 baskets of No. 2, and 2 baskets of wild grapes lons, to which I added 54 pounds of brown sugar, gar, and left it in the vat between 4 and 5 hoursgrees, and tunned. August 17th, collected two baskets of grapes No. 1-pressed and fermented brown sugar, and let remain in the vat all night,of its density, or weight, since it was tunned .-Added 5 per cent. of brandy.

Pressed Must, . . . 77 gallons. Racked Wine, . . . 62

Lost by fermentation and lees, 15 gallons.

The wine was much improved, but somewhat December 24th, racked again and sulphurtart. ed-The clear wine 61 gallons, and was quite potable.

was decanted into other bottles. In Feb. 1, 1823, the wine of 1821 had become turbid by reason of the frost: it has now become again clear, and must be decanted into other bottles :- I have seldom drank a better wine than this is, of Madeira part of the winter, but it is again nearly clear: they must be decanted, as soon as quite clear into smaller vessels, and observed a difference in my wine of that year, favourable to that which had remained a few hours in the vat before pressure,-it was more bland and pleasant; the other which was pressed, as soon as mashed, was somewhat tartish.

1823, the weather had been favourable for a short time, and on the 6th August I collected 5 of another grape, which was of a deep blue co. liked the flavour; but it now wears off. lour and quite harsh tasted, both quite ripe: The whole quantity of Must in 1823, 173 galls. mashed them, and the mere gout was 91 degrees by the Hydrometer (sp. gr. 1.072)—added 15 pounds brown sugar and let it remain in the vat Must from 86 vines No. 1, and 30 vines ? four hours and pressed off nearly 11 gallons of No. 2; on a quarter acre of ground,

-season very dry: August 24th, collected the must, in which the Hydrometer raised to 151 de- Loss by fermentation and lees 20 per ct. 31 galls. ter rose 121 degrees: Thermometer in shade the taste is quite different: if it shall improve by keg and demijohn, to ferment. Sept. 8th, racked wine is no longer a desideratum in the U. States. the wine into sulphured vessels, and added 8 per If the strength of this wine shall prove to be sufficient, I will make no alteration in the fabrique which was bottled clear, which seems to hint, wine added to it. It is the first time that I have that wine should have had a greater action on made a wine of this grape, so nearly by itself; the second lees. This wine is now (1824) a fine but in the future I will manufacture my grapes sefull bodied wine resembling Madeira wine good parately. The weather became dark and wet, and I lost at least a third of my grapes No. 1 by

August 10th, collected 3 baskets grapes No. 1; berries, and mashed in a vat by 3 o'clock, P. M .- No. 3,-in all 13 baskets. Mashed No. 1 and 2 rain prevented my pressing until 7 o'clock. The together,—the mere gout was eight degrees of mere gout was 8 degrees, about a fourth of the strength; and the wild grape No. 3, yielded mere whole, and the juice by pressure was 7°, and the gout of 11 degrees by the Hydrometer: mixed principle in must of wine, has done its duty, it mixt was 71 degrees of strength—quantity 45 gal- all together in the vat,—added 52 lbs. brown suwhich raised the must to 14 degrees, nearly, of pressed, and cut up the mare twice-the must the Hydrometer: Thermometer in shade 8210, - was 15 degrees (sp. gr. 1.114) - must 37 gallons that is necessary: fining before the wine is want-I did not try it in the must. August 12th, col- when tunned, and of a full Madeira colour, with ed for use, or to be bottled, is like taking physic, lected 9 baskets of grapes No. 1, and 4 baskets a slight purplish tint. On the same I collected a when a person is in good health :- as Judge Peof No. 2, and obtained 32 gallons of must, 7 de-basket of wild grapes No. 3, and a basket and a ters would say-let very well alone grees of strength,-added 33 lbs. brown sugar, half of wild Muscadine (scupernon) which were which raised the Hydrometer to, large, 13 de just ripened: the Muscadine gave juice of 6 degrees, only, mixed and mashed, and added 12 lbs. without additions,—it was poor stuff and consigned to the vinegar cask. Sept. 7, my wine tasted degrees (sp. gr. 1.107) and tunned in a demijohn Rhenish. October 12, racked off wine, and sulphured: tried the Hydrometer in the wine, and I ever tasted; it is richer than the best Medoc, it sunk to 1 degree below zero-and was lighter and perhaps more resemblant of the best Burthan rain water: it had lost 15 degrees, nearly, gundy, -but the taste of Burgundy I have much forgotten. The grape No. 3, I conjecture when manufactured by itself will make a wine equal to little next year. I propose to make some very the finest Medoc. I must be indulged with a little puff about this wine, and that made from good substitute. From our facts in the art, we grape No. 2, for really I am pleased with them ;but not too fast, for I may be like the Owl and the Crow, in the fable in praise of their young : they may be strong enough. On the 21st of August, collected 12 baskets of No. 1, and 4 baskets as to shew if I am right or wrong in practice; No. 2, mashed, and mere gout 8 degrees—added and I assure you of my good wishes for your suc-The wine of 1820, had considerable lees, and 69 lbs. sugar, and left in the vat 4 hours; pressed cess, and of the pleasure it will give me to hear off 501 gallons-must 14 degrees. On the 29th from you, when any thing shall turn up that you August collected 9 baskets No. 1 and two baskets believe may be useful in our common pursuit,-No 2, mashed and added 47 lbs. sugar-I omitted and I will follow suit. I should like to have a to try the strength of the must, -quantity 38 gal-sketch of your practice, and your critique on my lons. The residue of my grapes ripened but illquality,—I think it rather strong. The wine of losing them altogether, by the rainy dark, weath-portunity can be had, I will endeavour to have er,-and supposing the quantity not enough to conveyed to you, through my brother, a bottle of fill a cask, I collected two baskets of wild Mus-In June, (1823) drew off a cask of the wine of 1822 cadine berries, which had generally fallen off the vines,-these I carefully washed and culled, and dried them in the air-and Sept, 11th, collected the remainder of my grapes No. 2 with a few of No. 1-mixed altogether and mashed-they gave mere gout 8 degrees-left in the vat all night, with 40 lbs, sugar added,—in the morning pressed off 29 gallons, of 14 degrees of strength—tasted strongly of the over ripe Muscadine, and as if baskets of grapes No. 2, and about & of a basket it had been sweetened partly with honey: I dis-

Deduct for wild grapes, . 18

Made Wine, . 124 galls. [of improved fabrique.

The wine, in which grape No. 2 predominates, is the best, at the present,—it gives a finer bou-quet, as well as flavour. The next season, I intend to make each grape separately; and if I can collect as many wild grapes No. 3, as will fill even a keg, I will try it by itself. I am not of the opinion, that the Muscadine will make a good wine

Wild Muscadine (scupernon) 6 deg. Beaume-specific gravity, 1.040 nearly My Vineyard grapes No. 1 and 2, 8° Beaume and specific gravity, Wild grape No. 3, 11° Beaume, and 1.060 specific gravity. 1.080

No wine, I conjecture, if strong, will be at full strength, until it has lived three winters; if weak. er, two winters. I object to fining altogether, unless for present use. When every component will remain, or, become excrementitious and full in lees, or go off in spume,-when lees subside. drawing off the wine in dry cool weather, is all

Since my last vintage I have obtained a copy of your essay, on vines and wine, together with M'-Culloch's books, -on both I place high value, and return my best thanks to you and to him. In this letter you will have a full view of my intentions, and experience, in wine-making. To all my wine made in 1823, I added 6 per cent. of my wine of 1822, instead of brandy, except the two kinds which I have puffed about, to which I have added nothing. My brother thinks my wine wants body; I think otherwise, but will increase it a can soon demonstrate, and build a theory of making wine, on unquestionable principles.

The candour which your letter evinces, has inmethod: by this I might discover error, and apmy several wines of 1823.

I am, Sir, Your most obedient servant, THOMAS M'CALL.

P. S. I am surprised at the quantity of brandy which is put into the foreign wines; but feel satisfied that it is correct: My vineyard grapes, will never arrive at a strength to make wine without some artifice,-not being stronger than about 9 degrees; -my wild grape No. 3, may possibly arrive at 12 degrees by culture, and may make a tolerable claret without sugar, but much better with some addition. I believe it to be untrue that any grape will make wine of Madeira strength without sugar, or an abundance of brandy.

5 Do. 2d best do. do. Straw or Grass Hat, imitation of Leghorn, 5 To the spinners of the greatest weight of cotton, wool, and flax, in 5 hours for each article, 3

IMPLEMENTS OF HUSBANDRY.

For the best Flax and Hemp Breaker from any hart of the world, which may be deemed useful and worthy of encouragement, For the best Agricultural Machine, or Implement, that may be considered new, and as deserving the notice and patronage of this So-

FERMENTED LIQUORS.

For the sample of the best Cyder of any preceding season, Gooseberry, rasberry, or strawberry wine, 5

PLOUGHING MATCH.

For the best ploughing by 3 or more horses or Do 2d best do.

Do. best ploughing by 2 or more oxen, To each of the successful Ploughmen,

For the best specimen, to consist of not less than five pounds, of Butter, and of one churning, to be sent in roll or lump,

Do. 2d best, as above

best preserved Butter, not less than 12 lbs. nor less than three months old,

Sealed labels will accompany each parcel sent breed of hogs, and accordingly on his return to

-and none to be opened but those which belong to the preferred sample. The mode of making and preserving to be described for publication in the American Farmer.

For the most successful experiment in waterrotting, or otherwise preparing flax or hemp -the quantity to be not less than 50 lbs.-The whole process to be stated,

VOLUNTEER PREMIUMS.

A Silver Cup, valued at twenty dollars, to be given to the owner of the best Calf, reared by hand, and to be not less than ten months old, to be exhibited at the next Cattle Show for the Western Shore. The owner to furnish a written statement for publication in the American Farmer, of the mode pursued, and the cost, including a reasonable charge for attendance, economy, and effect to be taken into view: -By D. Williamson, Jr.

A Premium of five dollars to the house wife who shall rear the greatest quantity of Domestic Fowls—in proportion to the number of Stock fowls:—By the Editor of the American Farmer.

To the author of the best essay on the natural history of the MULE-and its value, for the general purposes of agriculture, in comparison with horses—the residence of the author not material -a Silver Cup valued at thirty dollars.

For the best essay (by any citizen of the United States,) on the value and use of Oxen, in com-5 parison with horses, in the Middle and Southern States-to be accompanied by a description of the best method of gearing and breaking them-a Silver Cup valued at twenty-five dollars:- Ry C. Carroll, of Carrolton.

For a description of the best and most economical method of rearing CALVES by hand, after they are not more than three days old—The calf to be exhibited-and to be not less than 6 months old-a Silver Cup valued at twenty dollars.

0 HOGS.

[It requires no argument to prove, that of all domestic animals, there is none of more value than the hog-He lives through the whole range of our various climates, and not a table is spread, from the humblest cottage to the most gorgeous palace, upon which his flesh does not make a portion of the repast, whilst he is so little of an epicure, that scarcely any thing is rejected by him. In town he plays his part more effectually than the two legged scavengers in our streets; and in the country the most offensive offal is converted, by his accommodating taste and strong powers of digestion, into the most valuable of all our meats. But such is the difference in the condition and the domestic habits of various portions of our country, 10 that the same breed of this animal is not every where best adapted to the farmer's purposes-The short legged hog of the Eastern States, where their swine are all kept up and fed throughout their lives, and finally cured into fat pork, would starve in the wide ranges of a Southern Wine of the native or cultivated grape, 10 plantation; where vegetables are raised in little variety, and hardly in sufficient abundance for the farmer's table, and where the hog must roam abroad during the greater part of his life, to seek a precarious subsistence in woods and pocosins.

An English farmer of excellent character and judgment, who came in the year 1823, with letters of introduction to the Editor of the American Farmer, and who travelled under his advisement, was present at the Cattle Shows of several states, and took very particular notice of all our domestic animals—before he left America, he observed, that he thought it would be in his power to contribute to the improvement of our

LITERATURE.

FOR THE AMERICAN FARMER.

Valuable French Publication, connected with several branches of Rural Economy.

One of the happiest features of the present age is that systematic and condensing spirit of modern writers, which presents to the reading portion of mankind a large mass of knowledge, within a comparatively small compass. The necessity of vast libraries has, in a great measure, been superseded, by well digested and compendious Encyclopedias, accessible from their cheapness, to almost every class of society .state of literature, science, and the arts.

D'Alembert and his learned collaborators had in the French Encyclopedia, which was first published, erected to the human intellect, a stu-pendous and imperishable monument. It was pendous and imperishable monument. It was afterwards found expedient to embody the imof water from the surface of the earth, has a mense result of their labours in an Encyclopédie yet been supported by an experimentum crucis. Méthodique, with considerable additions. Eng. and on that account, our philosophy of the must

not commence measuring the rain until June.— The average depth of rain, for each month, we measured, was 3 1-16 inches. The season throughout has been dry. The greatest change of tem perature in twenty-four hours, occurred between the 11th and 12th Feb. The Thermometer fell from 63 to 16—making 47 degrees.

Editorial Correspondence.

Extract of a letter, dated Raleigh, 15th Jan. 1825.

"Large quantities of this year's "crop of Cotton" are daily going on to Fauetteville, which has become, in a measure, the "market-town" of the The navigation in the Cape Fear river, on which it is situated, is rapidly improving under the able direction of our distinguished Engineer, Hamilton Fulton, Esq.

Your's respectfully,

N. B. The Millet you were kind enough to send me is fine indeed, yielding largely. The Mammarkably well."

Newberry, Jan. 14, 1825.

"Mr. John Gage, of Union, a few years ago, grafted a pear upon an apple scion in his garden. When it grew up, so as to begin to bear, it bore for two years, very excellent pears. The third and fourth years, it was barren; but during those years, its leaves, which formerly were those of a Communicated by Major W. B. BARNET, Naval pear tree, changed, by degrees, to those of an apple tree. The fifth year, and ever since, it has borne excellent apples. This has been related to Messrs. Feason & Co., Gas-Light makers, of Livme by at least fifty of the most respectable men erpool:on the spot, who personally knew it to be true, so that I have no doubt of its correctness.

JOB JOHNSTON."

Woodly-Farm, 24th Jan. 1825.

TO THE EDITOR OF THE AMERICAN FARMER.

Dear Sir,-A case of hydrophobia happened about three months since, with one of my dogs, which was followed by two others, two and three weeks after; all of which were killed immediately on discovery. The last was a favourite bitch that had pups four or five weeks previous to her madness, and the pups destroyed except one. which was taken from her because she neglected it. I felt every assurance that this pup had escaped the infection; being kept entirely distinct from its mother three weeks previous to her madness, but judge my surprise, when seven weeks after, this pup went mad, snapping at every body near it. I am at a loss to conjecture whether it imbibed the disease from the nourishment afford ed by its mother, or whether it received the infection from a bite from its mother some weeks before she betrayed symptoms of madness. With regard to the symptoms of madness in dogs, they are equivocal, though one symptom is a substantial evidence, that other dogs will avoid and run from that which is mad, and which I have proved with mine. A common idea prevails in the country, that if a dog escapes nine days after being bit, he may be let at large, and no further alarm apprehended; to correct this, I feel it a alarm apprehended; to correct this, I feel it a duty to give the foregoing statement, which you flamed part. No reliance is to be placed on sweet can use as you please.

And am, respectfully, yours, JACOB HOLLINGSWORTH. result of experiment.

Extract to the Editor dated, Union-Town, Jan. 26, 1825.

"Having lived in this county upwards of forty years, I had tried many ways to preserve Bacon, the ley of wood ashes. for having been raised in old Virginia, I am very fond of good bacon and cabbage; but I need not bugs, flies, skippers, rust, and ransidity, and now is the time for others to satisfy themselves .- It was as follows :-

On taking my meat from the pickle, for I fill my tubs with strong brine, as soon as the meat is salted, I boiled the brine and skimmed it clean of of the extract of walnut bark, or any other purall filth, and put it away in the tubs again-When the meat was well smoked, being afraid to venture the whole of it, I packed away six hams and two shoulders, in the brine again and kept them down with boards and weights. This brine was quite pure and sweet when I went to salting this treat this disease properly, shut your eyes to fall.—The bacon which had been thus well smo-all authorities, or forget all that has been said moth Pumpkins were planted too late, owing to ked, and put back again in brine and kept, chiefill-health, to succeed well; the Bene Seed did re- ly, until this fall, was so good and pure as to atly, until this fall, was so good and pure as to at-tract the notice of all that eat of it—besides, the fever turned inward upon the bowels, and he flavour being well preserved, there was no outside rust to pare off and throw away.

With respect, your humble servant,

JEREMIAH KINDALL."

Recipes.

Officer of this Port.

Cement used for Steam Apparatus, given by

5 cwt. Boreings,

24 lbs. Sal. Amoniac,

1 bs. Sulphur.

To every cwt. of Boreings add 8 ounces of Sal. Amoniac and 4 ounces of Sulphur, making only one cwt. at a time.

MEDICAL RECEIPTS.

Remedy for Sore Eyes .- Dissolve an ounce of salt-petre in a quart of water, with which fill a wine glass and invert over the eyes, (each) for about a minute every morning. Wash the eyes wine glass and invert over the eyes, (each) for about a minute every morning. Wash the eyes with the same, weakened with the addition of more water. This is said to cure weak and inflamed eyes.

Md. killed a hog on Monday week, which weighted 533 pounds. The weight of this hog on the 20th March last was 70 pounds—making an inflamed eyes. flamed eyes.

Another .- Boil half an ounce of Cammomile flowers in a pint of new milk, and wash the eyes three or four times a day.

Another .- Open the eyes over the steam of boiling spirit of turpentine.

To prevent a Lock Jaw, from the foot being pierced with a rusty nail.—Immerse the foot in experienced no change whatever—Flour, from

Cure for the bite of the Rattle Snake .- Give half a tea-spoonful or a tea spoonful of strong spirits of hartshorn (volatile alkali) in a glass of water every 5 or 10 minutes, and wash the bitten

(February 2d,) and but one excessively warm day, TO KEEP BACON—Hams and Shoulders, fure wounds with safety, and probably advantage. It (June 29th,) during the whole season. We did and sweet and free from skippers and rust—the is practised by the Indians The Virus only has effect when taken into the circulating blood, but has no power when taken into the stomach.

> For the stings of Bees and other poisonous insects.-Wash the part with spirit of hartshorn or

To prevent the Dysentery or Bloody Flux .here repeat the various experiments. Last spring, Avoid exposure to damp or night air, and avoid I tried a method which proved effectual against costiveness. When the dysentary appears in a neighbourhood, school or family, purge all those who are well, with a dose of salts. Doctor Rush says he knew in the army, in the last war, the health of a whole regiment preserved by this means. When salts are not to be had, pills made gative will answer. Such means as burning tar, drinking rum and garlic, &c. &c. are either use-

> To Cure the Dysentery or Bloody Flux .- To upon it for the last 150 years. Old Sydenham, knew the disease better than his followers. By bearing this in mind, the disease is manageable If the pulse (as it usually is) is hard, and the face is flushed, bleed freely at the arm, and repeat if necessary; give a vomit of Ipecacuanha, ash bark, or any thing else, and purges of Salts or Castor oil, or any thing that is neither astringent, acrid or heating; but the disease is to be attacked in the skin by promoting profuse sweating, by covering close in bed, applying hot bricks quenched in hot water, and drinking largely of warm balm or hysop teas; antimonial or nitrous medicines may be given, but no opiates until the inflammatory symptoms have abated.-There is no one specific remedy in this disease: like all others, it must be treated according to its symptoms. In general, bleeding, purging, and sweating will cure it. Those who consider it a local disease of the bowels, and give brier root tea, Port wine, cheese, spices, &c. &c. always do much harm.

RARE PRODUCTION.

Well Done !- Mr. Lewis H. Foote, of Elkton, in two hundred and seventy days!

"I have given to the inquiries you have done me the honor to make on the subject of the cultibe procured by boring, cheaper than any other vation and manufacture of hemp, all the conside-way now known. The temperature of it will of ration my desire to comply with your wishes would suggest, and now beg leave, with diffidence, \$450 per ton; but, in the year following, the imdrink in summer, and in winter there is no danger to submit the result. Being engaged in the maof its freezing as when brought in conduit pipes; nufacture of cordage for twenty-five years, the then, the cultivation of American hemp has another methods required frequent expenditures to article of hemp has been of primary importance. nually lessened. For the last eight or nine years, keep them in repair, but a well of the kind we For several years we used Virginia hemp chiefly; have been speaking of, when once properly made, believing it to be of good staple, and only requirwill continue to furnish a supply of water in all ing pains in preparing it, we took a good deal of the manufacturer, because it is clean, easily workprobability as long as the earth revolves on its trouble in urging the growers of it to be particular in curing and cleaning it. In the years 1809 A few years since, the Corporation of Baltimore and '10, Russia hemp being scarce and very high, caused pipes to be laid to convey water from a spring in Howard's Park to Market-Space, at great expense; one-tenth part of which, I believe, expended in boring and tubing would have the advantage and necessity of improving it, and To, Russia nemp being scarce and very high, we urged on Messrs. Caruthers, of Lexington, Virginia, (large dealers in the article) and living in the neighborhood of the best hemp country, lieve, expended in boring and tubing would have afforded a supply of water fully as large, perhaps contracted to give them \$290 per ton, for 70 to purer, but certainly almost, cooler and more re-Caruthers paid particular and personal attention Water may now be had in a pure state, and at a moderate expense, in places where heretofore, if it has been obtained at all, it has only been by bridge, Botetourt, and Montgomery counties, on expending large sums in establishing and main. expending large sums in establishing and main- the James, Jackson, and Cowpasture rivers, and mode in Russia of classing the hemp into three the quantity of it, may now be improved and en- Knowing that the practice of preparing it was by hanced in value; and the inhabitants of populous dew, or air rotting, which is very tedious, it lying strong staple, and good colour -indeed, the longcities, who have been exposed to all the diseases out for months, exposed to all the vicissitudes of and other inconveniences incident to the use of weather, and is often thereby injured in strength, means so well prepared as the Russian, and, conbad water, have now an opportunity to improve always in colour, in the year 1810, Mr. Theo, sequently, not so easily worked; it is doubted by their health and increase their enjoyments by in- Armistead, who was Navy Agent here, and also had a rope walk, and who was very zealous in and though we have, and are making some expethe improvement of country hemp, with our es- riments on it, they are not yet satisfactorily provtablishment, held out strong inducements to have ed. It makes excellent white rope. Manilla the hemp water-rotted, in place of the usual hemp, or grass, (I have used some parcels of it) mode, but so difficult is it to change old habits, is very strong and wiry, and said to be well suitthat only in one instance did we succeed. Col. Wilson C. Nicholas, of Albemarle county, and formerly Governor of Virginia, water-rotted his crop, and, to encourage and extend this mode, we gave, for the part of it we got, (a few tons) \$360 cultivation of hemp of great national importance, per ton; the quality was excellent, colour much both for cordage and sail cloth, too much pains 25th September, 1824. improved, and, we believe, the fibre, also, in the cultivation of Hemp, I am not acquaint-strength and fineness, though it was not so well

why this difference, one lot was not properly the cultivation of it; it will be their province to ted hemp, broke with

many of the existing objections to American hemp may be removed. Many parts of the western country, I am told, are well adapted to its growth; and, I believe, a great part of the lands in North Carolina and Virginia, watered by the Roanoke, would vield it to great advantage. It may be proper here to remark, the cause of hemp having been so high in 1809 and '10 was, that very little was imported; that from Russia sold at \$400 to portation was so large that it fell to \$200; since we have used Russia hemp almost exclusivelyproportion about 7-8 and 1-8. It is preferred by ed, with but little loss, and is of good colour .-Sea-faring people give Russia hemp a decided preference; they say it looks much better, wears better, and some are of opinion that American hemp is not well suited for water rope, as cables, &c.; and, also say, that the constant friction of the water washes the tar from it, and that it soon decays. I believe, however, that most of these objections are more matters of received opinion than from well tested experiments. I find that cona) and found it to be of excellent quality, est and strongest I had ever seen, though by no some whether it is as well suited for tarred rope, ed for some smaller purposes, untarred; costs about 50 per cent. higher than the Russian.— American hemp is generally about three-fourths the price of Russian and Ancona. Deeming the cannot be taken to have its quality well ascertained; tending to which, if the Legislatures of the states where it is cultivated would establish inspections, and have persons appointed competent to its duties, I am of opinion it would greatly fer a premium for a quantity, not less than fifty tons, to be water-rotted, carefully culled, and well

This last was 21 inches also; but it must be the farmer requires but an approximative result, observed, that a considerable part of the hemp the experiments there consigned, will be found was damaged very materially in the transportation, and, it is highly probable, that the whole of it had suffered some loss of strength.

Thirty yarns in each rope.

=05 SIMPLE METHOD OF TESTING THE FERTILITY OF SOILS.

Read at the Maryland Academy of Sciences by J. T. Ducatel, Professor of Agricultural Chemistry to the Maryland Agricultural Society; and by the Academy communicated for publication in the American Farmer.

This easy method of ascertaining one of the requisites of a fertile soil, belongs to the distinguished French Chemist and Apothecary, the Chev. Cadet de Gassicourt, and is derived from the known attraction existing in different degrees, be-tween water and earth. Starting from this fact Mr. Cadet has studied to determine the proportion of absorbent power, possessed by soils, in their various degrees of purity. From his experiments he has deduced these facts: that a dry soil, absorbed the most water, and abandoned it in the shortest space of time, in proportion to the quantity of argil which it contained; that a calcareous soil is, next to the argillaceous, that which has the strongest attraction for water, but which, on the other hand, abandons it the soonest; that a sandy soil absorbs water in least quantities, but that it retains it longer than a calcareous soil .-The fertility of soils then, depending in a great measure, upon the property which they have of absorbing a certain quantity of water, and of retaining it a sufficient length of time, to facilitate the developement of the root, to carry food to the plant, and determine the germination of the seed, without, however, affording too great a degree of moisture; in order, consequently, to become acquainted with this degree of fertility which a soil possesses, Mr. Cadet proposes the following easy method within the reach of every farmer:

Having previously cleaned the superficies of the soil, which it is intended to test, of all loose vegetable or animal substances, ten or twelve pounds of the earth should be taken and passed through a coarse seive, after which they are to and having previously adapted to it a filter of soil has been too much extended to be applicable the premiums to the successful candidates. here.

Art. 13. The Society shall meet on the section that section the section the section that section the section th transparent vessel. Fifty ounces of the soil, are then for a first experiment, weighed with precision, and placed on the filter, taking care not to compress the earth in the least-fifty ounces of water, weighed with the same precision, are then exactly the time the water takes to pass through it. When the soil on the filter will have ceased able paper. to emit bubbles, the superfluous water contained in the vessel should be carefully weighed, and the diminution or loss of the fifty ounces indicates, without error, the quantity absorbed by the soil. This experiment is to be performed four times, upon the original quantity of earth prepared for that purpose. The sum of the results of these experiments taken, and the mear proportion de-the Agricultural Society of St. John's Colleton, termined; that is, the fourth-part of the water S. C. absorbed, and of the time the superfluous part Art 2. The officers of the Society, shall conhas spent in passing through the filter—then the sist of a President, a Vice President, a Treasurer, annexed table may be consulted, the numbers approaching the result obtained, sought for upon it. Although there be an infinite variety in the degree of absorbent power possessed by soils, as considered as the anniversary of the Society.

ARTICLES OF ASSOCIATION for the Agricultural Society of St. John's, Colleton, S. C.

Art. 3. It shall be the duty of the President, to

Art. 4. In the absence of the President, the Vice President shall take the chair; and in the absence of both, the members present shall nomi-

nate a President, pro tempore

Art. 5. The Treasurer shall keep a true, and just account, of all monies received, and expended, and shall annually present to the view of the Society, a detailed report of the state of the treasury. All demands against the Society, shall be settled only, by an order from the President, countersigned by the Recording Secretary.

Art. 6. The Recording Secretary shall register

all the proceedings of the Society, and take charge of all the books and papers, which may, from time to time, be entrusted to him: he shall keep a correct list of the names of the members, and of all donations to the Society, with the names of

the donors

Art. 7. It shall be the duty of the Corresponding Secretary, to carry on the necessary correspondence of the Society; to collect and distribute the best samples of the most useful seeds, roots, grains, &c .- to revise all reports and communications, before they shall be made public by authority of the Society; and to make a regular report of his proceedings.

Art. 8. At all elections for officers, a majority of the votes, of the members present, shall de-

cide the election.

Art. 9. The fee of admission for each member, shall be \$5, and the annual contribution \$5, to be paid at every anniversary meeting. - The payment of \$35, at any one time, shall constitute a life member, who shall not be subject to such annual contributions.

Art. 10. Any member neglecting to pay his arrears, for two years, shall no longer be considered a member of the Society, and the same shall

be entered on the journals.

Art. 11. All applications for membership, addressed to the President, shall be read at one meeting, and considered at the next; but no applicant shall be admitted without the concurrence of a majority of the members present, nor until he shall have signed these articles.

Art. 12. There shall be a committee of five

Art. 13. The Society shall meet on the second Wednesday, in the months of July, September, November, January, March, and May, at the hour of 11 o'clock, A. M.; seven members present shall form a quorum.

Art. 14. The members of this Society shall be distinguished by the terms, resident and honorary. Art. 15. This society shall be empowered to

make such by-laws, as may be deemed expedient, and necessary to carry into effect, the objects of the Institution.

Art. 16. The foregoing articles shall neither be altered, amended, or repealed, without the consent of two-thirds of the members present; nor cultural Society of St. John's, Colleton, S. C. shall any motion, having that object in view, be Art. 1.—The style of this association shall be, considered the same day on which it is offered.

HORTICULTURE.

FOR THE AMERICAN FARMER.

PLANTING APPLE ORCHARDS. Sir,-The following mode of planting an orchard of apple trees is suggested, as possessed of many advantages over the old method. By this the trees are planted at 50 feet every way, to give them room to grow and spread to their full extent, and to work the ground between them for their benefit, and the crop produced. The disadvantages arising from this mode are so many, so great, and so fatal, as to have suggested the one now proposed in the place of it. These disadvantages are, 1st. the trees grow up with a straight body, 6 or 7 feet high, before they are suffered to produce their limbs—this large body is soon filled with worms under the bark, which is pecked into holes all around, by the small wood pecker, searching after them; these two causes soon bring on the canker, which in a little time causes the decay and death of the trees .- 2d. They frequently grow crooked and deformed, which is not only unsightly, but a great injury -3d. Their bodies and large branches become full of moss, and "We have been fovoured with the sight of ground is cultivated between them, grow luxuricomes into bearing, taking care to suffer no strong growing spongy shoot to grow beyond its fellows, but keeping all of equal growth and size. When the tree comes to bear four of these branches, each alternate one, all around the tree, is to be headed down to its lowest shoot, which is to be You will oblige me by having the following en-trained in the vacancy of its parent branch, which commencement of puparation, to the seeding of four that have been left are bearing, which they grass seed, in salt bent marsh:—

will do in plenty for three, four or five years, until Quere 1. After the marsh is embanked; the the new wood has come into a bearing state, which may be known by the fruit buds which they 2. Whether the plough (after burning) or spike will show in plenty in every part. When these harrow, would be most advisable to get rid of the new branches have arrived at this state, then cut out the four old ones that have borne fruit, and are now getting up pretty high, and bearing mostly on their tops; take care in cutting out

Very respectfully, your obedient servant, EDWD. B. HICKS.

[The above letter was read by the Editor of the American Farmer, to the Maryland Acadeseason. The stems or bodies of the trees, and the regularity, the health and vigor of the trees, my of Science, and was referred to Mr. Girardin, President of said Society, and Professor of Botaed with soft soap and water, which encourages and consequent profit, their perpetual renovation ny to the Maryland Agricultural Society, who re-

Baltimore College, Feb. 7th, 1825.

and others; but, for reasons which it is needless to specify in this place, it has, together with the Pyrola umbellata, lately much extolled for the cure of cancers, been separated from that genus, and a new genus constituted by the name of Chimaphilla, (winter loving plant.) Pursh, I believe, first made the separation, and subsequent Botanists have judiciously adopted it. It belongs to the class Decandria, order Monogynia of the Linnwan system, and to the LXVth family (Erica) in the method of Jussieu. The vulgar many of the contributions to your paper, I feel rous plants is Winter Green. The species to which I have alluded as used for the cure of cancer, goes under the appellation of Phipsesawa .-I have generally found the plants of this family in pine-woods, in shaded and rather moist situations. They flower in June and July. I deem it unnecessary to give a particular description of the plant, as it is pretty generally known. I see abundance of it as well as of the Pyrola, or Chimaphilla umbellata (Phipsesawa) exposed for sale in our markets by country people. I shall only observe that it has received the specific name year. To all those whose orchards are in this eight hours; and I have never known, or heard of Maculata on account of the white streak, extending along the nerve of the acutely serrated leaf, on its upper surface.
I have no Medical Botany at hand—but I re-

collect the bitter taste and astringent qualities of this genus of plants. The properties, effects, &c. of the Pyrola or Chimiphilla maculata have. no doubt, been stated by Barton, Bigelow, &c. to whose works I refer those of your readers as may wish to know more about this plant and its pro-

which you are engaged. Shattered as my time and attention are between the multiplied duties but never fresh stable manure. The salt in the mud conduces to the health of the trees, destroys wash the dirt off and put it into a vessel, roots Maryland Agricultural Society have conferred upon me, by appointing me their Professor of Botany; and I am too ardently devoted to the premotion of useful knowledge, not to embrace cheerfully every practicable opportunity of contributing, so far as my humble abilities will permit, to the widely diffused illumination of which the "American Farmer" is the focus.

> I salute you, with sincere esteem and respect, L. H. GIRARDIN.

Domestic Economy.

Baltimore, Nov. 22d. 1824.

Sir,-Observing that you are desirous of adding to your lists the productions of domestic his way, and it is not more than that from Boston. tio Ross, Esq. of Rossie, and G. Fullarton Carhousewifery, Mrs. Parker sends you specimens of Yours, respectfully. housewifery, Mrs. Parker sends you specimens of her hard soap; the piece marked A, has been made about thirteen years, the other B, was made the last spring, and C, at some intermediate time. Enclosed is a description of the method Mrs. P. uses in this article.

With respect, I am, Sir, Your Ob't servant, THOMAS PARKER.

John S. Skinner, Esq. Sec'y to the Maryland Agricultural Association.

Method of making Soup.

1st. The ashes from the hearth are carefully collected, especial care being taken that no soot be mixed with them; a few weeks before the soap is to be made, the ashes, with a very small proportion of quick lime, are placed in the hopper and charged with water.

2d. Preparation of the fai—what I make use of for soap, is termed "Scum Fat," i. e. what is taken from the dripping pan, and skimmed off the pots in which meat is boiling.

The fat is boiled with water to separate all ex-

traneous matter.

3d. Take about fourteen pounds of fat, put it into a tight barrel and throw on it at first, strong lye (what will bear an egg) say two or three or four gallons, and afterwards add weaker lye to fill the barrel. If the ashes are from oak wood, the lye will be stronger than from hickory wood, and a larger proportion of fat must be used. The above is attended with less trouble than the old method of boiling the fat and lye to make soft soap, but not so quick .- The directions for the last method are, take the same proportion of fat, and with the addition of the strong lye, set over the fire and boil slowly until the soap begins to form, and then add weaker lye.

4th. To make hard soap-The soft soap is set over a gentle fire until it boils, and then salt added until it becomes thin-then poured into tubs or wide vessels until cool, when it is cut into convenient pieces.-I have generally re-boiled this hard soap with the addition of about one gallon of strong lye to each hundred pounds of soap.

Yours, respectfully,

[Note on the above.-We cannot deny to our correspondent, the right to make the above remarks; indeed, we are not sorry that the publick should be enabled in this way, to give honour to whom honour is due .- The letter from which the extract was made, was full of interest in relation to the general subject of feeding swine, but the writer stopped us, by those emphatic and forbid-ding cautions—"for your own eye." Hence it was, that we did not designate either the writer's name, nor even give the cue of the name of the farm. But it seems that in New England, he who runs may read-however we do not say who naked facts of the age, and weight of the hogs, to justify the remarks we had made, upon the Hayheld swine-pen, at the time it was published. As for a description of "Fatherland Farm," we can lar, that he was carried through the kingdom only ask Mr. B. P. to be prompt; the more minute the description of farm management and produce, the better we should like it, if the owner did not object; moreover, if ever again we have the happiness to enjoy the never to be forgotten hospitality of Mr. G. P. and his neighbours, Fatherland Farm will not escape, what it can so well bear, a visit of inspection.]—Edit Am. Far.

Sporting Olio.

From the Annals of Shorting.

A forced March, on the spur of curiosity .-Dear Sir,—" Credit to whom credit is due," is set off between five and six o'clock on Menday ceived this morning) the comparison of Hayfield's ven the same evening, having walked the whole in Tottenham court-road, for 100 sovereigns aside, pen of swine, with those of Pennsylvania and distance, (with the exception of six miles,) from October 13. The animal competitors for the Essex county, Massachusetts; as the owner's York to Doncaster and back again, seventy-two prize were, Razor, a white dog, the property of

A boy, fifteen years of age, undertook, for a Essex, and state of Massachusetts, in the Parish three hours and five minutes. He had underta-called Byfield.—The farm is known by the name ken to walk six miles in one hour at Wakefield, Soon after the battle was over, it was found of "Fatherland Farm," and is owned by Gorham the day preceding, for the trifling sum of two that Razor had been poisoned! and he died; the

Parsons, Esq. of Brighton, who inherited it from shillings and sixpence, which task he performed his father, (the late Ebenezer Parsons, Esq.;) (we are told) in about three minutes and a half within the hour.

> Shooting .- A bet of magnitude between Horaday, September 18,—the former betting that he would shoot as many partridges on his estate, in the space of five hours, as the latter would do on the estate of Ethie in the same time. The day being fine, and the fame of Mr. Ross as a marksman being well known, a great number of sporting gentlemen were on the ground. Mr. Ross killed thirty-one and a half, and Mr. Carnegie ten brace, the former gaining the bet by twenty-one and a half brace.

> Fine grown ox, bred and fed by Sir William Maxwell, of Monteith, on his lands in Galloway, was slaughtered at Ayr, late in September. This animal was extraordinary in many respects. He reared in Scotland, not only in bulk, but surpassed them likewise in symmetry of form and in beauty of skin. Indeed, he was considered so singuin a caravan, exhibited as a public spectacle, and was well known to the world by the name of "Fat Charley." He was the produce of the farfamed Teeswater kind, and of a cow of the equally famed Cunningham breed, and was about eight years old when brought to the shambles. The four quarters weighed 105 stone, of 16 ounces to the lb. and 16 lbs. to the stone. The tallow weighed 13 st. 5 lb. and the hide 7 st. 8 lb.; and exclusive of offal, the beast weighed 125 st. 13 lb. 1913. Through the rib, the thickness measured 91 inches, and the fat alone down the back 41, and on the back bone 5.

> Archery.-The annual Butt prize (being a handsome piece of silver plate, set out by the "Irvine Toxopholite Society") was shot for at their Butts, on the 6th and 7th of October. It was won on the latter day by Mr. John Dean, Post-master of Irvine.

LONDON.

A higeon belonging to a person at Liege, in he Netherlands, was set loose at Lyons, in the south of France, on August 3, at six o'clock in the morning, and arrived at Leige at eleven o'clock, the distance being about 290 miles.

The Science and Slang of Dog-FIGHTING,-as practised by Colonels, and other "Gentlemen of England."

A match took place, at Reuben Martin's pit, Colonel Egerton; and Driver, a fallow-smut, the property of Oxford Bill. It was evident at set-ting-to, that, in point of strength and courage,

THE PARMER.

BALTIMORE, FRIDAY, FEBRUARY 18, 1825.

The meeting of the Trustees of the Mary land Agricultural Society, held on Wednesday, at Mr. Caton's, was a full one, and its proceedings highly interesting and important. We have neither time, nor space, to give a full account of them.

The Judges for awarding the Premiums at the Cattle Show in June, were appointed. A communication to the Committee on Agriculture in the Legislature of Maryland, was read to the Board by the Corresponding Secretary; approved and ordered to be published. In like manner a detail of some highly important experiments, by a gentleman on the Eastern Shore of Maryland, was read to the Board; for which they passed a vote of thanks to the author, and a resolution that they be published in the American Farmer.

A Committee was appointed, consisting of R. Caton, D. Williamson, Jr., and Jas. Carrol, Esq'rs. to prepare Rules and Regulations for the government of the next Agricultural Exhibition. All Turkeys, in the market, 621 to \$1-Geese, 50these, with other proceedings, will be detailed in Beef, best pieces, 8-Mutton, do. 6 to 8 cts.-Live our next number. The Board finally adjourn Cattle, \$4.50 per cwt.—Apple Brandy, 25 cts,—ed to meet again on Thursday, (yesterday,) four Herrings, No. 1, \$2—No. 2, \$1.75—Hay, per tor

the culture of Cotton is tast extending in Virginia-That even not far from Richmond some planters are turning their attention to it, and cultivating from twenty to one hundred acres per year, thus regarding it as one of their chief sta- from 23 to 25 cents-3 years old, 31 cents

At a meeting of the Board of Trustees of mented deeply the loss which had been sustained ment of by this Institution, and by Society at large, in the death of one of the most distinguished ornaments of our scientific and literary circles—distinguished not for wealth, or the unenviable rank and power it confers; but for highly cultivated talents, a liberal and generous spirit, and that enlarged and enlightened philanthropy, which in duced him to throw open for the common benefit of mankind, the various stores of his intellectual harvests-abounding in seeds, and fruits, of all kinds of useful knowledge.

Aware of the estimation in which the deceased was held by the Board, he but anticipated their feelings, by offering the following Resolution,

which was unanimously adopted.

Resolved, That the Board of Trustees of the Maryland Agricultural Society, have heard with sincere regret of the death of their late Professor of Botany, L. H. GIRARDIN. In him the school Of last summer's growth; red, sapling, and of general science has lost one of its brightest white Clover Seed; Orchard Grass; Timothy; scholars, and the Maryland Agricultural Society Herds Grass; Millet; Lucerne; St. Foin, and one of its most active and useful members. The Board sincerely condoles with the family of the deceased, and will observe it as a melancholy but imperative obligation to cherish his memory.

terature, convened at their rooms on the occasion be furnished as above. of the melancholy loss of their late venerable President, L. H. GIRARDIN, the following resolutions were moved by William Frick, Esq. and unanimously adopted.

Resolved, That the members of this Academy one of its most distinguished ornaments.

ate remembrance by his brethren of the Academy, dles and hand boxes. for his virtues and talents, his efficient and unwearied exertions in the cause of science, and his pre-eminent participation in their labours; and that in testimony of their high respect, the members of the academy will wear crape on the left

arm for the space of thirty days.

Resolved, That Mr. J. T. Ducatel be appointed to deliver before this Academy at its next annual meeting, the Eulogium of the deceased.

H. H. HAYDEN, Vice President. P. MACAULAY, Secretary.

PRICES OF COUNTRY PRODUCE.

Flour, from the wagons, \$5-Wharf do. \$4.75 to \$4.87\frac{1}{2}-Wheat, 90 to 95 cents-Corn, 35our next number. The Board finally adjourn ed to meet again on Thursday, (yesterday,) four weeks, at Eutaw, the residence of B. W. Hall, Esq. on the Harford road.

N. B. The day of meeting has been permanently changed from Wednesday to Thursday.

The Culture of Cotton.—The Editor was surprised to learn, in conversation last week with several members of Congress of that State, that the culture of Cotton is fast extending in Virgis to 33 cents.

AGRICULTURE.

FOR THE AMERICAN FARMER.

INCREASE OF THE DEVON CATTLE.

A Devon Bull, two years and six months old, may be used from the first January, 1825, to the first July, 1834, when he will be twelve years old.— One hundred and fifty cows have frequently been served by one bull within On the 1st April, a season. If he were allowed one hundred and ten cows in a season, deducting nine per cent. for accidents, one hundred calves would annually proceed from him; and allowing his male offspring to beget twenty calves each, in the term between the age of fifteen and twenty-seven months, and onehundred calves every year thereafter, the extraordinary number of 9,870,000 animals will have been produced on the first of July, 1834; which, estimated at one dollar per head more than the common cattle of the country, would make the enormous sum of nine million eight hundred and seventy thousand dollars gain to the community.

Notwithstanding the objection which has been brought by a distinguished gentleman of Massachusetts, against the attempts to largely improve our native breeds of cattle, by crossing with those of the best European stock, from the limited numbers which could be affected by the imported blood, it appears, that nearly ten millions of animals, might proceed from the loins of one bull within the term of nine and an half years; without regarding the offspring on the female side. If it should be objected that 15 to 18 months of age, is too early a period for a bull to procreate, I would observe, that a bull has the faculty of procreation at a much earlier age, and if restrained from more connexion with a cow, than is absolutely necessary, and properly fed, and kept up, in the English practice, his form would not be materially injured, nor would his usefulness be impaired .- Or, if it should be suggested, that sufficient allowance is not made for accidents, or defects in the males, and for the small portion of original blood which would be found in remote generations, it should be recollected, that the blood from the heifers is excluded, that their offspring in the fourth and fifth generations, arising from intercourse with the original bull, would, in the language of breeders, have nearly sunk the native blood. Thus their male calves would beget animals it is presumed, nearly as well suited to the climate and general uses of the country, as the parent male himself.

But to put aside all question of the fairness of the statement, take half the amount, giving 4,935,000, and one-tenth of the value supposed to be attached to the improvement in the various offspring, of consequence varying exceedingly from the hrst to the last generation, and therefore estimated at but ten cents in each animal, the large sum of \$493,500 would be the gain.

If any error in the calculation has arisen, it is hoped that it may be pointed out as I have no other object than the desire of exhibiting to your readers, the importance of Cattle Shows, Farmers' Journals, and Bulls.

Baltimore County, Feb. 8, 1825.

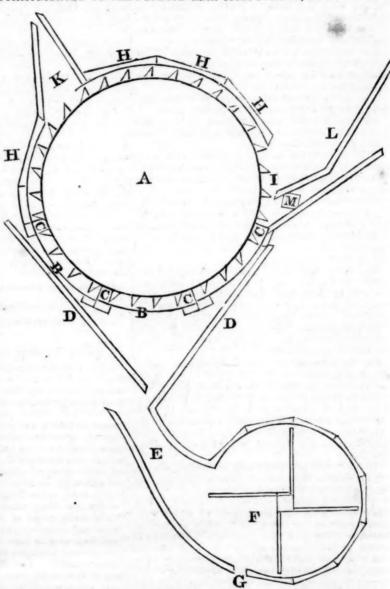

LABOUR-SAVING, COTTON-SPINNING MACHINES-ARE THERE ANY TO BE HAD? -OF WHAT DESCRIPTION AND PRICE, ADAPTED TO FAMILY USE? Notoway, Jan. 24th, 1825.

Dear Sir,-The inhabitants of this part of Virginia, have for some years (for reasons which it is unnecessary here to mention) been under the necessity of manufacturing their own clothing, at least for their domestics. As we wish only to labour for ourselves, and to labour with the greatest facility, we have, many of us, been desirous of procuring a "Cotton Spinning Machine," for our private families. Such were conveyed through some parts of this State a few years since, with from six to ten spindles, and such would now find ready sale amongst us. Would you be so good as to enquire through the medium of your paper, where such machines could be procur- constructed, was put in operation by horse power, on the farm of the invened? what would be the probable cost? what moving power would be re- tor, in September last, and cleaned at the rate of one and a half bushels of quisite to spin a given quantity? By complying with the above request, you seed an hour. It was however discovered, that the power of one horse would serve many others besides your humble ser't, W. J. DUPERY. was inadequate to give it motion sufficient to do its best work.

FOR THE AMERICAN FARMER.

Description of Burrall's Clover Machine.

COMMUNICATED TO THE PENNSYLVANIA AGR. SOCIETY, BY D. K. JONES.

The annexed diagram is intended to represent a longitudinal cut through he machine, from end to end. Shewing the situation and arrangement of the different parts.

A. Shews the end of the cylinder, and one row of teeth.

B. B. B. The bed, covered with perforated tin sheets. C. C. C. C. Four leather stops, attached to the bed.

D. D. Sliding boards, to conduct the seed into the trunk of the fan.

E. The trunk of the fan.

The fan.

A YANKEE.

G. Opening in the fan, through which the clean seed falls. H. H. H. The cap, or covering of the cylinder.

I. The feed opening.

K. The chaff opening. L. The front board of the hopper.

M. The shaft of the feed roller.

This machine is the invention of Thomas D. Burrall, Esq. of Geneva, in the State of New York, and is in extensive and successful operation in the

western part of that state, by hand, horse, and water power. The first machine on this plan, and one of the largest which has been NES.

I where it is \(\frac{1}{4} \) of an inch wide.

The sides of the cap extend the length of the machine, which, together with the cap, form three sides of the hopper. The other side is made by sliding a board in grooves, cut in the sides of the cap, at their extreme ends. The bottom of the hopper is hinged to the lower edge of the last mentioned side, and rests on the feed conceive, most interesting subject to the agricultary and most insportant property of this grass, in which the experience of all concurs:—It is well known that the second crop of clover and most other grasses causes ptyalism, or as it is vulgarly called, the slaver in horses, the debilitating effects of which are obvious; now the orchard of the last mentioned side, and rests on the feed conceive, most interesting subject to the agricultary. of the last mentioned side, and rests on the feed conceive, most interesting subject to the agricul- grass on the contrary has no such effect, and my neighbours who cultivate it are in the habit, when The foregoing description is a light water power. Of all the various artificial grasses proposed as their horses are labouring under the salivation The motion of the cylinder is from the feed to-wards the chaff opening, and requires to pass which I have read, or which have fallen under other grasses, of turning them into a field of orthrough 2,000 ft. of space in a minute, to do full my own observation, I know none so well adapted chard grass, which never fails to correct it in the work. The motion of the fan is taken from the to our soil and climate, as that generally known course of a few hours. This fact of the orchard cylinder by a cross band, and should perform \$\frac{1}{4}\$ by the name of orchard grass (botanically, docty-grass not causing ptyalism, is confirmed by Judge

Peters' experience of nearly half a century, as man, his lordship not allowing a driver. Each he states in the communication to which I have ploughman had six oxen, three working four, before alluded.

I had intended entering more fully into this sub ject, and to have drawn a comparison between this and the other grasses usually cultivated; but standing jest of the adjoining farmers, for the set, after working one half of the day, to rest the finding the subject so much more ably handled in small quantity of work they performed, and the other half—and I have myself seen a yoke of a communication contained in the Agricultural expense it was done at. Almanac for the last year, published under the direction of the Philadelphia Agricultural Society, that I have been induced to forego any further it should be so. remarks, and to request your re-publication of that article in your valuable journal, being satisfi- oxen, wishing to know, whether working or feeded that coming from so highly respectable a source ing them will be most advantageous, makes a cal-that it would be entitled to much more weight culation similar to that contained in the Northumthan could be expected from any individual com- berland report, he will not long hesitate to chose munication. I have no doubt of the accuracy of feeding; and particularly in a district possessing the statement there given, and can vouch in ad- a breed of cattle, that can be so'd fat to the butchdition to it, from my own observation and experience, for the great superiority of the orchard old, and having horses of such peculiar activity grass over all others for pasturage, particularly and exertion, and capable of bearing such extra in seasons of drought which are unfortunately of fatigue, as to perform in hurrying and critical too frequent occurrence. I have seen this excel-seasons, double the ordinary work; which is quite lent grass at such times afford a very good bite, incompatible with the disposition and nature of when the clover and other grasses were complete- oxen; for if they be driven a little beyond their ly parched-it also resists the hoof and tooth, natural pace, they are soon exhausted and give puts up more rapidly after having been eaten up; and are incapable of further exertion for down and affords good pasturage much earlier and some time afterwards, let the necessity be ever later than any other grass.

I am well aware that the price of orchard grass as almost to amount to a prohibition of the culture of it; but the farmer who has once got into ces not unusual, and in the ordinary management, sion, and accuracy as the horse; it has appeared the seed of it can continue to supply himself with of a farm, a voke of them, may very advantageless labour and expense with this than with any ously be employed, but to suggest whether the preference is so decidedly in favour of the latter, other grass seed, as an acre of tolerably good soil advocates of ox-labour, in the warmth incident as to more than compensate for any little extra will produce from fifteen to thirty bushels of seed, to the prosecution of a favourite opinion, have (Judge Peters says from thirty to fifty) which not, when they have, for the general purposes of will be sufficient to sow the same number of acres; a farm, stated that oxen were much superior to the securing and cleaning it is attended with no horses, been betrayed into a very exaggerated desirable in cettle are, small consumption and expense, and with not much more labour than the view of the matter. same quantity of grain would require. In addition to which, after the seed has been saved, he mentioned in the extract, and that it is impossimay go over the same ground and cut a crop of ble to fatten them to advantage before five or six hay; and at the present reduced prices of grain, years of age, I answer why not then procure the crop of seed would be at least as valuable as them; they are already in the country. At best any other crop which could be raised on the ground.

Much more might be said in favour of this valuable grass, but it is hoped that the facts already portunity of judging for themselves.

I am, with respect, your obedient servant, AGRICOLA.

ON THE RELATIVE VALUE OF OXEN AND HORSES.

FOR THE GENERAL PURPOSES OF AGRICULTURE Buck's County, (Penn.) Feb. 1825.

To the Editor of the American Farmer.

Sir,-As upon the much controverted point of the preference of Oxen to Horses for the general purposes of farm labour, the argument in the pages of the Farmer, has hitherto been almost entirely upon our side-it has occurred to me, to send you, the following extract from "Bailey's Survey of Durham," made by order of the En-glish Board of Agriculture.—If you should think it worthy of publication in your very useful pa- the King's Norfolk farm, that it is necessary to are found to prevail in preference to the latter .per, you can insert it when convenient.

"Oxen were, within my remembrance, much used in this district, but were then beginning to give way to horses; the late Earl of Darlington, day; and an other of their zealous friends says, of cultivation is very peculiar, or where the culabout 30 years since, was their last great advo-that four oxen will draw 80 bushels of barley, or tivation of arable land is upon a small scale, and cate; he kept 10 or 12 ox-draughts for several oats, performances which, in those who have subsidiary to the more important objects of rearyears; had them yoked in collars one before anobeen accustomed to employ good horses, must ing and fattening cattle, and of making cheese
ther, three to a plough, and driven by the ploughexcite a smile.

hood at the time, and recollect that they were the

At present I have not heard of a single oxdraught in the county; and it is no wonder that

er at so early an age, as from two to three years

so great."
The object, in bringing forward these remarks,

If it be said that our oxen are not of the kind it is but an apology for a practice founded upon existing circumstances, which I am ready to admit, but not an argument for a settled principle.

When it is asserted that the ox is as fast as the stated will be sufficient to induce the farmers of horse, have not the advocates of the farmer, been Maryland to make the experiment of it, (if it be comparing in their minds, the best of one class only on a small scale) that they may have an op- with the worst of the other; forgetting that it is as much the interest, and as much in the power, of the farmer to procure good horses as oxen, and will they not acknowledge, that, when the com-parison is fairly made, the horse is far superior to the ox in intelligence, spirit, agility, activity, wind, endurance of heat and of long continued fatigue, and in the power of making extraordinary exertions at critical seasons, provided, there be an increased allowance of food! In the latter very friends, is allowed entirely to fail; a failure, which in the course of a very few seasons, constitutes a very heavy balance against him.

With respect even to the quantity of work performed under ordinary circumstances, I think it will be found that the performance of the ox has been frequently overrated. In the favourable climate of England, it is stated by the manager of allow his cattle to rest one day in five, and he mentions very triumphantly that under his treatment four oxen will plough nearly an acre per

It has also been mentioned to me, by an intelligent farmer of this county, who had a long expehours in the forenoon, and the other three, four rience with oxen, and who employed them al-hours in the afternoon. I lived in the neighbour-most exclusively, that he found it necessary to hood at the time, and recollect that they were the keep double sets of them, in order to allow each good oxen, in the hurrying time of hauling in hay, refuse to draw a load-and thus subject the owner to the inconvenience and delay, of getting his horses from the stable at a distance, which When a farmer that has four three years' old have then taken an additional weight without inconvenience, and with much greater alacrity and speed-for it is well known, that when an ox has once refused to pull, that it generally happens that neither persuasion nor violence will induce him to make another effort.-I have also seen a yoke of oxen harrowing in a field of grain in the month of April, dragging the harrow at a snail's pace, with their tongues out and apparently almost exhausted, while a pair of horses were performing, perhaps in the same field, the same work with ease and cheerfulness.

It is not, however, denied that an ox carefully selected, will walk a mile, or plough one-fourth of an acre, in as short a time as the generality of horses; but the question ought to be, will he, taking into view the various operations to be performed upon a farm, the produce of which is also I am well aware that the price of orchard grass The object, in bringing forward these remarks, to be taken to market, perform in the course of seed has heretofore been so extravagantly high, is not to condemn entirely the use of oxen; on the day, and much more in the course of the year, the contrary, it is thought, that under circumstan-'as much work, with the same neatness, precito me, that in these essential particulars, the expense in keeping, and for the entire loss of his value, after 15 or 16 years of faithful services.

The qualities which are universally considered early maturity; in the female, large secretions of rich milk; and in the male, (as also in the female, when dry,) a great propensity to become fat, a quiet, placid temper, and an indolence prompting to sleep, as soon as satisfied with food. These qualities appear, in a great measure, in-compatible with those which are required in an animal intended for labour; and it is a fact that the most celebrated breed of working oxen in England are inferior to the Herefords, as grazing stock, and to the Improved Short Horns, both as

grazing and dairy cattle. It has sometimes been asserted, by way of argument, that the Greeks, Romans, and Asiatics, have used oxen in preference to horses; to which it may be added, that on the continent of Europe, it has in some instances been thought advisable to perform the farm labour with cows, and that the harness is so very economical, as to consist of nothing more than the cow's tail, fastened to the plough, thus dispensing with both horses and oxen. The answer to all this is, that the system important particular, the ox, by his most zealous of agriculture pursued by the ancients and eas-friends, is allowed entirely to fail; a failure, tern nations, when compared with the improved state of modern husbandry, may be pronounced barbarous in the extreme.—And it may be re-marked, generally, that in proportion as improved systems of cultivation have been introduced, so it has been found necessary to substitute the horse for the ox-and that, almost universally, in the most highly cultivated districts, the former There are, no doubt, some exceptions in the case of intelligent and zealous individuals, and also with respect to those situations where the mode

With these exceptions, I think, the proposition will be found to be correct.

P. S. In the 45th number, vol. 6th, of the Farmer, is the following observation-" I have many years cultivated onions on the same spot, and have never found the land at all impoverished by them-but on the contrary, my crops are better than formerly. But the manuring is yearly repeated, and must not be laid far below the surface."

This paragraph so far from proving the assertion of the writer, conveys to my mind a contrary impression; for if the crop be not exhausting, where is the necessity for annual manuring? and Extract from the Report of the Secretary at War in what way is it remarkable that the soil should improve? Would it not do so under crops confessedly exhausting, with the same system of annual manuring. As regards the question itself, no opinion is here advanced.

In this would have become hollow at no very distant performing the operation. It appears to us have failed, or very few only giving fruit. In this latter instance the soil was very thin, and less faster wounds made by the pruning knife; healing of the wounds made by the pruning knife; healing of the wounds made by the pruning knife; healing of the wounds made by the pruning knife; have failed, or very few only giving fruit. In this latter instance the soil was very thin, and less faster healing of the wounds made by the pruning knife; healing heal of each tree.

The third orchard to be noticed was set out in about 1767. This is altogether of grafted fruit. Its most flourishing condition was in 1798, when over 160 barrels of fruit. The marks of decay stands northeast from, and near to his barns, is have been visible in it for several years, though large, and grows in a good soil—and he has often the trees are still somewhat productive.

It would seem, therefore, from these instances, that the apple tree acquires its greatest productiveness in a little over thirty years, and that its continued state of vigour and of decay, occupy tilated and solemn memorials of former usefulness.

short lived utility.

Some which stand pre-eminent, as exceptions to all rules, are now to be mentioned.

In the fruit bearing season of 1822, I visited the garden of the Wyllis family in Hartford, Con- that gentleman. It can hardly be expected to necticut, to see two extraordinary trees. The look further back. one an apple, said to have been imported before the middle of the 17th century, by the old Secre- Hon. NATHANIEL SILSBEE,tary from England. The appearance of the tree was that of decay. It had been, probably, long hollow. At this time, as near as can be recollected, little more than one-third of the circumference remained; of this the bark was sustained by a thin layer of wood, A few weak limbs at the top bore some dozens of apples. Of these I brought and exhibited at the anniversary dinner Brighton, a sample. The fruit must be considered ordinary; its flavour was of a bitter sweet .made me look back to this incident more particularly, was, that about the same time, an English pearance, and will no doubt live many years. this tree were noticed as quite extraordinary.

There is also a tree near where the Indian meeting house and burying ground in Natick were been prolific. The fruit is good; and there can Shore, free of charge, to the Exhibition held by formerly, standing on an acre of ground given by be no doubt of its having been engrafted.

Shore, free of charge, to the Exhibition held by the Society on the Western Shore.—(Passed formerly, standing on an acre of ground given by be no doubt of its having been engrafted. an Indian to the Apostle Elliott, so called, which has been in bearing within a few years, and is said to have been a favourite apple with the Indians; it has obtained the name of the "Orange Sweeting." If this tradition is correct, this tree forest trees had better be deferred to another opacquired nearly as many years; for this celebrated preacher, whose influence was so great among these tribes, died in 1690; and it was probably some years before, that he received this testimo-

ny of regard from his Indian admirer. Of the size of the apple tree, 8 or 9 feet circumference occasionally occur.

As to product, I have also seen mention made of 50 bushels on a tree.

But both these points are so well exemplified in the county of Worcester, by a letter from W. STEDMAN, Esq. of Lancaster, that I cannot do better than close this part of my subject by an extract therefrom.

"I have an ancient apple tree which bears eve-ry year a very large reddish and yellow skinned half an inch thick, and suspend them through the five inches, and four feet above, ten feet four in-

it out, that "he put a peck of oats at the bottom itime since, who you know is a noted arborist, ob-1 of the whole host of heavenly signs. The best

"Of all trees for product, there is an apple tree on the farm of Thomas W. Ward, Esq. our Sheit produced upon one and three-fourths acres riff, in Shrewsbury, which is pre-eminent. It over 160 barrels of fruit. The marks of decay stands northeast from, and near to his barns, is assured me, he has made several years ten barrels of cider from its fruit. The last year he

made about eight barrels from it." The pear tree is sometimes intermixed with the apple in orchards, but oftener in gardens, or about that period. Some, to be sure, remain mu- favoured spots of smaller extent. It is doubtless bake it as a hoe cake, until it (the cake) is brown, of longer life than the apple tree, and bears fruit and then beat it all together; it will then be The mode of practice by some, of cutting off for a greater extent of years. Many of very anold limbs, to produce young wood and more fruit, cient date have been known in this city, particu-wherever I have seen it practised, has been of larly one in the garden of Major Melville. But I am enabled to give through the polite inquiry of the Hon. Mr. Silsbee, President of the Senate, the particulars of the celebrated Danvers tree of Gov. Endicott, in a letter from a descendant of

Salem, December 4, 1823.

Dear Sir,-The ancient pear tree in Danvers, about which you particularly inquired, was imported from England, and planted by Gov. Endicott on his farm in 1630. It stands on a hard clay bottom covered with a rich soil more than a foot deep, sheltered from the westerly winds, but exposed to the easterly. The ground has been of the Massachusetts Agricultural Society, at cultivated as a field ever since it was planted, but no particular care has been taken of the tree until the last seven years, since which for antiquity's It might have been useful for baking. What has sake, it has been kept enclosed, the ground dug and manured, new sprouts have made their aptraveller was collecting a small box of the apples, girts just above the ground six feet eight inches, which he took with him across the Atlantic, and and tapers but little to the crotch, which is four presented to some Society, as I saw in a journal of feet six inches from the ground. It never was a that country; and the age and circumstances of tall tree; the top is now about fifteen feet high, and is entirely hollow. Valuable Experiments.

IMPORTANT EXPERIMENTS,

Made under the direction of the Secretary at and J. Wood, New-York.

WASHINGTON, 21st Feb. 1825. To the Editor of the American Farmer.

Dear Sir, -Some time last summer, Mr. Gideon in this District, invited me to a trial between the himself, and several others of the most celebrated construction in our country. I attended the trial, but doubted the accuracy of the mode by hollowing table: gree of power necessary to impel the ploughs in proportion to the work performed. On stating my objection to Mr. Davis as to the accuracy of the mode, he expressed much solicitude that such experiment should be made as would give satisfactory results, which I promised him should be done, if he would furnish the ploughs, and the means of making such experiments. Orders were accordingly given to the Officers of the Engineer, and Ordnance Departments, at the seat of government, to institute a set of experiments in order to ascertain the rules which ought to be applied in determining the degree of power necessary to move ploughs of the same construction, opening furrows of different depths, and different widths, and which, being once ascertained, there would be no difficulty in determining the relative power, necessary to put in motion ploughs of different construction, according to the work performed by them, as is usually the case, those compared open furrows of different depths and

I send you a copy of the report of the Officers, which will give you the result of the experiment, as far as made, on six of the most celebrated ploughs used in this neighbourhood, as the information may be interesting to your numerous ag-

ricultural readers. I am, very respectfully,

Your obedient servant, J. C. CALHOUN.

Washington, 14th Feb. 1825.

The Hon. JOHN C. CALHOUN,-

Sir,-In compliance with your instructions, the undersigned have examined and subjected to the requisite trials such ploughs as have been sub-mitted for that purpose, the result of which is exhibited in the following report:-

Five ploughs were submitted by Mr. Gideon

Note .- Plough No. 5, was made after the celebrated Scotch plough.

This table exhibits the average results of nu-Davis, of George-Town, D. C. They were first merous trials, and is therefore more to be depend- they were before being moved by the plough. Davis, of George-Town, D. C. They were first merous trials, and is therefore the description of the usual manner, by ploughing a small ed upon, than if single trials only had been made.

The two first columns show the width and depth piece of ground with each, by means of horses.—

The two first columns show the width and depth understood to be of some note, and of high repunders to as of the furrows; the 3d, gives the area of a trans certain the power required in each case to move verse section of the furrow; the 4th, shows the tation in different parts of the country. They them. The Dynometer, which was so construct-power actually applied in each case, to draw the were all furnished by Mr. Gideon Davis, and ed as to show single pounds from one to nine hun-plough; the 5th, gives the number of pounds redred, was attached to the clevice of the plough quired to each square inch of the furrow; and nished also all the means necessary to try them.

As we have found Dr. Davis's plough to be desuch manner, that the force applied in moving the plough, acted directly upon the instrument. the relative merits of the respective ploughs.— The results obtained in these trials, were very unequal, varying in some instances, nearly ninety king any given furrow with plough No. 1, 147 the main body, consists of one piece; the share, per cent. This difference, it was conceived, was pounds would be required to make a similar fur- or cutting edge or point, is another piece; and greater than could have resulted from the various row with plough No. 6; or, which is nearly the the heel or shoe, forms the third piece. The

ment used was incorrect. The results not proving three horses, in the other. The last column gives satisfactory, we suggested other methods which the relative power reduced, as it would appear,

As it was found, that we could not measure passing from the axle to the clevice of the plough with precision the first furrow made in the ground,

To guard as far as practicable against any eroccasion, had been re-adjusted since, and was tri- rors, either of accident or design, no part of the ed at the same time with the wheel and axle; operations, which could possibly affect the result, was entrusted to others. In all the trials the The accuracy of the Dynometer being now satis- ploughs were guided by one of the undersigned were several times repeated, and the mean of the The results of these trials are exhibited in the results taken, we believe the table exhibits as correct a representation of the facts, as the nature of such operations will permit.

The ground upon which the trials were made, is situated upon the margin of a small water course, and is composed principally of sand, with a small proportion of clay and vegetable matter, and is covered with a very stiff green sward, which, however, is brittle, in consequence of its being composed mostly of sand. The specific gravity of the earth in its natural state before being broken up, was found to be 1664, or 104 pounds per cubic foct.

In examining the ploughing, which had been performed with the several ploughs by horses, a most striking difference was observed. The ploughs numbered 1 and 3 greatly surpassed either of the others; the furrow slice, was raised and turned over in one continued and unbroken belt, and laid in its whole course parallel to the furrow. The earth in its passage up the mould of these ploughs, and while turning over, appeared to be so bent, or twisted, as to crack or break it into very small parts, without tearing the sward asunder, and in such manner as to leave no large clods, but to pulverise the whole. But little difference was observed in the work performed by these two ploughs, No. 1 was, however, thought to be superior.

Ploughs numbered 4 and 6, appeared to break off the furrow slice in lengths of from 21 to 31 feet, and to cast them off separately, in a direction oblique to the furrow; the forward end of the piece lying in or near the furrow, and the other end at some distance from it. Thus,

The ploughs numbered 2 and 5, appeared to break the furrow slice in very unequal and irregular masses, and to throw them off in all directions, leaving large unbroken clods as hard as

were in excellent order for use. Mr. Davis fur-

As we have found Dr. Davis's plough to be decidedly superior in most respects, and generally superior in all, a brief description of it is here forms and properties of the respective ploughs; same thing, a piece of work which can be per-two latter are made separate that they may be and, therefore, it was presumed, that the instru-formed with two horses, in one case, will require renewed, as they do not wear so long as the other

Vol. 6.-50.

cast iron by means of screw bolts, and without varied, while their depths are increased as above. principles of its construction could be investigatmaking any mortices or tenons. This method of uniting the several parts of the plough, and which is found in that of Mr. Davis's alone, we consider a great improvement, as it unites simplicity and cheapness of construction, with increased strength and durability. This method also gives facilities which is not possessed by any other that we have depth of a furrow, without varying its width, the seen, for adjusting the plough, by making it incline to, or from the land, or make it penetrate more or less deep, at the pleasure of the ploughman.

In all the trials, which are exhibited in the foregoing table, we endeavoured to make the ploughs form furrows as nearly similar in width law of resistance in such cases. The deductions and depth as practicable, from the belief, that in necessary for this purpose, can be drawn only cases where ploughs removing equal quantities of from very numerous trials, repeated under all the earth, by penetrating to unequal depths, the pow- variety of circumstances and combinations, of er required would also be unequal; and, that the greater the depth of the furrow, the greater have, however, been sufficient to prove, that the would be the resistance the plough would meet with. With a view to determine whether this ficent data for determining the resistance to belief was well founded, and if so, to obtain some ploughs; but that the depth of the furrow, is also data upon which to compute the ratio of resistance, the following trials were made.

shallow furrow was made; then with the same ral ploughs, it will be seen that their depths are plough, a narrow and deep furrow was made, the unequal. We have endeavoured to deduce the particulars of which are given below, in connex-true results, by making proper allowance for ion with those of former trials made with the these inequalities. We took the mean of all the

14.57 12.28 9.01 Width of the furrow, inches, Area of the furrow in square inches, 63.00 66.31
Power applied, pounds, 336.00 379.00 7.75 70.05 336.00 372.00 487.00 6 09 Pounds per square inch. Proportion of power applied, 94.00 100.00 122.00

In these trials it will be seen, that the areas of the transverse sections of the respective furrows, are very nearly equal; while the power applied in drawing the plough, was very unequal. proportion of power per square inch between the shallowest and deepest furrow, is, as 94 to 122, a difference of about 30 per cent. The depths of the furrows are 4.32 and 7.75, the ratio of which is about 1.8. The power applied per square inch is 5.33, and 6.9, the ratio of which is about 1.3.-Therefore by increasing the depth of a furrow, (without increasing its cubical content) in the ratio of 1.8, the power must be increased in the ratio of 1.3. From this it may be inferred, that by doubling the depth of a furrow, the power must be increased by at least one-third; or, which is the same thing, if three horses are required to perform the work in one case, four will be necessary in the other.

Again, by comparing the first of the above trials, with that extracted from the foregoing table, we find the depth of the furrows to be, as 100 to 125, and the power applied as 100 to 106. To determine these several points, a much more Hence it appears, in this case, that increasing the extended course of experiments is necessary. depth of a furrow one fourth, causes an increased Such a course, we conceive, should embrace a resistance of 6 per cent.

To illustrate these principles more clearly, we give the following examples: supposing, in the depth of furrow, and with different degrees of first instance, a furrow is made 4 inches deep velocity in each case. The power required to and 12 inches wide, and the power required is equal to 100. This case will then form the basis upon which all the other calculations are founded.

	Depth.	Width.	Aren.	Power.	
1st,	4 in.	12 in.	48	100	
2d, Depth increased 1	, 5	96-10	48	106	
3d, do. 4.5,	7 2-10	6 2-3	48	130	
4th, do. doubled,	8	6	48	1331	

part. The three pieces are all of cast iron, and that as the widths are diminished, and the depths it's perfection an object of such deep interest to are united by two screw bolts. The beam and increased, the power is increased also. In the the great body of our fellow-citizens, that a well handles, are united together, and secured to the following cases, the width of the furrows is not regulated series of experiments, by which the

			D	lepth.	Width.	Area.		Power.	١
5th.				4 in.	12 in.			100	I
6th.				5	12	60		1323	١
7th.				7 2-10	12	86	4-10	234	١
8th.				8	12	96		266 2-3	1

Here we see that by adding one-fourth to the power is increased one third; and, if the depth be increased from five to eight inches, the power is doubled; and that if the depth be doubled, the have here recommended. power is nearly trebled.

These trials are by far too limited, to warrant our making any attempt to lay down any general which such operations are susceptible. They cubical content of any furrow, is not of itself suf- To ascertain the comparative advantages of firean important element in the calculation.

By referring to the first table, which gives the Plough No 1 was used, and first a wide and dimensions of all the furrows made with the sevesame plough, and exhibited in the foregoing table: furrows as the basis; and from that, with the fur- from the ear, were put into 11 pounds of boiling row actually made in each case, computed the results which are given in the last column of the table.

> The velocity with which a plough is drawn forward, while under trial, is a circumstance which requires attention. We made a few trials with a view to determine the effect of varying the velocity. We found, that the power required to give and brought to the state of hominy tolerably well the ordinary velocity to ploughs, was much great- cooked, the mess was found to weigh 15 ounces. er than that which was just sufficient to move it; the proportion being as five to four. These trials like those varying the depth of furrows, were not sufficiently extended to enable us to lay down any general rule upon the subject. It is evident, however, from the few trials we have made, that the velocity with which the plough moves, as well as the depth to which it penetrates, are circumstances necessary to be noticed in any trials which are intended to determine the comparative merits of different ploughs. The results obtained in such trials, may be very erroneous if these circumstances are not duly regarded.

In conclusion we beg leave to state, that all the trials we have mentioned were made in the same kind of soil. Whether the different ploughs tried would give corresponding results in different soils, we are not prepared to say. In this, like the cases before mentioned, further trials are necessary before accurate conclusions can be drawn. trial of all the different ploughs; in all the different soils; with all the varieties of width and velocity in each case. The power required to move the plough, together with the manner in which the work was performed by each, and the appearance of the ground afterward, should be noted in each case. The data obtained in this manner, would not only determine with great pre- the boiled corn. cision the relative merits of the several ploughs now in use; but, when viewed in connexion with the peculiar form and structure of each, would In all these cases it will be seen that the con-probably lead to farther improvements. The ten ounces of boiling water, and the boiling was

ed and developed, and its further improvement upon just principles be promoted, would doubtless result in much public benefit. The use of the plough in the public service, at the remote posts on the interior frontier, where the system of cultivation has been adopted, is very considerable; and together with its use in the construction of military roads, is sufficient, in our opinion, to warrant the further experiments which we

Respectfully submitted.

DO-EXPERIMENTS

paring and using by various processes, and in different forms, several kinds of grain, &c. for food for hogs, cattle, &c. Communicated to the Trustees of the Maryland Agricultural Society, and by them ordered to be published in the American Farmer.

INDIAN CORN.

Five ounces of corn, (avoirdupois) just shelled water, and boiled for ten hours. As the boiling evaporated the water, the vessel was filled up with a pound of cold water as often as appeared necessary. Six pounds two ounces of water were used; and when the boiling was done, there were eight ounces of liquor, five of which were thick and rich, drained from the corn. Thus drained,

This experiment was made with two views;first, to find what would be the increase of weight and 2dly, whether the process of boiling would not produce every desirable effect, without the trouble and expense of having the corn ground into meal.

CORN MEAL.

Five ounces of unsifted corn meal were mixed with one pound ten ounces of scalding water .-Before it had boiled long, fearing it might burn, one pound ten ounces more of water were added. The meal was well cooked in one hour; but the mess being thinner than was wished, the boiling was continued for some time to evaporate the water-but the meal appeared to hold the water by a powerful attraction, and parted with it very slowly. When the process was stopped, the mix-ture was thinner than mush, or hasty pudding; but rather thicker than gruel, and was in an excellent state to give to a sow suckling a farrow of pigs. The mess was again put into the scales, and the five ounces of meal were now found to weigh over thirty ounces.

The meal may be cooked with one-fifth of the fuel, necessary to cook the corn.

LADY PEAS.

Five ounces of lady peas were next cooked .-The mess when thoroughly done and drained, weighed fifteen ounces; but they yielded no rich liquor, and appeared like a very inferior food to

Five ounces of rye were put into one pound tent of the respective furrows are equal; and plough is an instrument of such general use, and continued for five hours, in the course of which to vell the gatent ibt-

the seedsmen, and they sent him orchard grass seed, believing it was the kind wanted.

is really perennial.

it is one of the earliest and latest grasses that grows, its colour is a beautiful dark green, its blades are smooth and glossy, it grows close and thick, does not bunch, and bears the hoof better not so much trampled on, has in places, given in the usual way. The distance between the drills way to ripple grass. Sown with clover on good ground, (and here let me observe it delights in a rich soil,) it yields an abundant crop of hay; and on the 28th of May, and were thinned with the and clover. They ripen at the same time; the to leave them 10 inches asunder; but this method Rye grass is vastly superior the first crop, but does not admit of the same exactness as trans-gives place to the clover the second crop, after planting. The Scotch acre would therefore con-which it makes a fine fall pasture, which every tain 26,356 plants, and the English 20,740. The kind of stock is fond of.

portion of oats was sown at the same time, to shelter the young grass from the frost, and harrowed in; the clover seed was sown in February, and it produced a clever crop of hay in June.*

It has succeeded with me when sown in April, but a gentleman who cultivated it largely, always IN MARYLAND-EXPERIMENTS MAKING IN CAROpreferred sowing in the fall. I have never seen this grass properly described, and I notice it to induce some of your readers to make trial of it.

* June following is produced the heavy crop.

To the Editor of the American Farmer. Sin - The advantages of the cattle shows to the agricultural community, in a greater or less degree, must be admitted by every one who has attended nected with it, a fair for the sale of live stock, grapes, a list of which I enclose you; can you say ly make an insipid wine, the Miller-Burgundy exand agricultural implements of all kinds. It was one of my objects in attending the last exhibition, (and I found it to be so with others) to purchase some country cattle, cows and oxen, work horses and mules, but there were none such there. If the ground be sufficiently extensive, and it did not bile Bluffs some years ago? interfere with the great objects of the society, would it not be well to erect, or permit others to erect sheds and enclosures, for the drovers and dealers, for the accommodation of their cattle; and dealers, for the accommodation of their cates white Muscadine, would it not be advantageous, both to the sellers White Muscadine, White Tokay, and buyers, thus to bring them together?

A. YOUNG FARMER.

[There can be but one opinion on the above question.—It has been one of the chief objects in Purple Constantia, Purple Constantia, the view of the Trustees, and we can promise, Red Oval, or Raisin that measures will hereafter be taken with more particular reference to it .- In the mean time, we can promise every accommodation that can be desired by those who may send any thing for saleand on the most reasonable terms.] Edit. Am. Far.

Great Crops.—Mr. John Ronald Titwood, on the estate of Sir John Maxwell, has a field of red-I have noticed this grass for upwards of twenty topped turnips, in drills, 28 inches asunder, and years, and think it the very best grass for a per-the plants, in consequence of deficiencies, at 18 manent lot, or lawn, or plat, I have ever seen, it inches distance. They were sown at the beginreally perennial.

ning of June, and after thinning, were repeatedMy farm house is situated in the centre of a ly dressed with the plough. The average weight square piece of ground, containing about one acre. of the turnip, including the top, is 12½ pounds, I sowed the enclosure with Rye grass seed twenty- at the rate of 88 tons per Scottish acre; without five years ago, and most part of it is now as thick the top, 9 lbs. or 68 tons per Scottish acre; without the most beautiful grass for a plat, of any other, nips have been sent to our office, they weigh, it is one of the earliest and latest grasses that without the tops 284 lbs. or 68 tons per Scottish acre.

Swedish Turnips .- We lately mentioned Mr. than any grass I am acquainted with. 'That part Denistoun's excellent crop of Swedish turnips, of my yard lying between the house and garden, cultivated according to the method of Cobbett. where it is must trodden, has not failed in any In a field almost adjoining, there is a crop still respect; the back part of the yard, where it is better, which were raised by Mr. Wm. Warnock, I think the heaviest crop of hay, per acre, I ever hoe, and parted and set up with the plough, acsaw cocked, was a lot of three acres of Rye grass cording to the ordinary practice. It was meant field in question, consisting of about half an acre, If intended for hay, it must not be suffered to was examined on Saturday, and the average get very ripe, as it then gets hard and wirey; if weight of each turnip, with the top, was found intended for pasture, it ought to be fed early, and to be 44 lbs. at the rate of 50 tons per Scottish not be permitted to run up to seed; if for a lawn out to seed; if for a lawn out the top, the root weighed 3 lbs. 10 oz. at the It may be sown in the spring or fall. The lot rate of 42½ tons per Scottish acre, ar 39½ tons per I referred to, was sown in September, after the ground had been put in complete order, a small larger than Mr. Denistoun's.—Glasgow Chron.

HORTICULTURE.

ON THE CULTURE OF THE VINE LINE COUNTY.

Potter's-Landing, Feb. 10th, 1825.

To the Editor of the American Farmer.

through your paper, suggest the most approved ples for eating that makes the best cider, and so distance? We have collected several kinds of it is with grapes, those best for the table generalapproved of for wine, that are not contained in plant foreign grape vines with an intention to

I am your humble servant,

WM. POTTER.

White Constantia,

Grape,

Jersey, or Guernsey, Red Hamburgh, Black Hamburgh, Red Frontignac. Burgundy, Madeira, or Malaga, Small black Cluster, White Sweet Water, Staunton, or Caroline, Schuylkill.

[Having no information, on the subject of the above letter, except what has been given in the American Farmer, the Editor referred the enquiries of Col. Potter to Major Adlum, to whose politeness he is indebted for the following reply.]

Vineyard near George Town, (D. C.) Feb. 23d, 1825.

To the Editor of the American Farmer.

Dear Sir,-I return you the enclosures of Gen. Wm. Potter, and the following is my reply :- If foreign vines are planted the rows ought to be ten feet apart, and the plants to be five feet distant in the rows. If native grape vines are planted the rows ought to be twelve feet apart, and the vines six feet distant in the rows. I have planted them closer but found the grapes did not ripen well, which was the cause of my adopting the above mode, and they ought to be trained as high as convenient, for the further from the ground the richer and finer the clusters; but the fewer foreign vines in the vineyard the better. The Susquehannah grape I do not know by that name, without it is an uncommonly large Fox grape .-The Red Frontignac I have, but it is a very bad bearer, and very few of them ripen. What is called the Black Constantia in the above list, I presume is what is called at Philadelphia and other places, the Cape of Good Hope grape, and if it is, it is a native grape, which I call Clifton's Constantia; and the small Black Cluster, I presume is what is called the Munier, or Miller-Burgundy. The white Sweet Water and the Munier, are the most common grape in the gardens of our country, the one called the White, the other the Blue English Grape. I have several of the other kinds mentioned in the list which I bought of Mr. Wm. Prince last year, but I do not expect any of them to bear fruit until next year; therefore I know nothing of them except what is said in books. I had a considerable number of foreign grape vines, but I had them grub-bed up before I began to sell the cuttings, and in future I shall only keep a few to supply those who live in towns with grapes for the table.

My advice to all persons who wish to plant vineyards, is to plant none but such as are certain To the Editor of the American Farmer. and good bearers, viz: the Catawba, Schuylkill Sir,—One of my neighbours and myself have Muscadell, Clifton's Constantia, or Cape of Good each determined to plant a small Vineyard this spring, say an acre of land each. We have se-ra, by some supposed to be the true Madeira, but veral treaties on planting, pruning, &c. mostly I think it a native; and to look into their own through your paper. We are in doubt as to the vicinity, when the native grapes ripen and to culproper distance to set the vine apart; can you, tivate the best of them, for it is not the best apwhat kinds are the most approved of for wine? cepted, as from it I have made a very fine wine. If you can suggest any other kinds that are well I have no doubt on my own mind, that those who the list above mentioned, you will do me a favor, make wine, will find themselves totally disap-Has there been any satisfactory report had pointed, as all persons have who have tried them from the Vineyards planted at or near the Mo- in this country, and it is the cause that vineyards are not as common as orchards, and that we have not been exporting thousands of pipes and hogsheads of wine annually. I also advise those who have foreign scientifical books, to put them out of sight, or perhaps it is better to throw them into the fire at once, and then they cannot disappoint themselves by referring to them, except McCulloch on making domestic wines, which is the only work I have seen worth attending toand as to cultivating the grapes with the use of a little common sense, an American will raise a bushel of grapes where a foreigner will not have a gallon.-At least all the foreigners I have seen cultivating the grape will be in that proportion.

Yours, respectfully,

JOHN ADLUM.

Domestic Economy.

ON THE STRUCTURE OF CARRIAGE WHEELS.

(To the Editor of the American Farmer.)

Sir,-An enquirer in your last number, wishes to know the reason why the axletrees of carriages are sloped from the shoulders to the ends, on the upper and hinder sides, and not on the lower and front parts; and observes that he has "often talked to workmen on the subject, but never could obtain any reasonable or satisfactory justification of their practice; only that they were sure that it was right, &c." The wheels are certainly nearer to each other at the lower and fore parts, than at the upper and hinder parts. The great advantage of this form of the axletree is, that the wheels have a constant tendency towards the shoulders, so much so, that a carriage well Newtown, Seneca Lake, to Lake Erie-lock-hung, will run without linchpins until some obstruction forces the wheel outwards. The weight bears most on the strongest part of the axletree, burg, Wilkesbarre, Seneca Lake, to Lake Erie by the wheels being nearer at bottom than at top; the under spokes are nearly perpendicular, and of course can better sustain the weight, and are barre, Seneca Lake, to Lake Erie—lockage by less liable to work loose, in the nave, than in an oblique position.

The great object of your Society, is to obtain practical knowledge, and although those workmen with whom your enquirer "talked on the subject, could never give him any reasonable or No. 6.—From Philadelphia, b builders of carriages of all and relied on than the theory of Ferguson.

IRON RAIL ROADS, AND THE STEAM COACH.

When the steam coach is brought fully into use, practice will teach us many things respecting it, I should much doubt. of which theory leaves us ignorant. With the famitted by mail, together with the thanks of your these inventions will prove of inestimable value. employed persons to throw all the roots which obedient servant, JOHN F. BUFOUR." Some persons doubt for instance, whether it is lay sufficiently near for a man to throw them. Some persons doubt for instance, whether it is lay sufficiently near for a man to throw them,

possible to keep so vast a territory as theirs united under one Government. But it is forgotten, that extent of the territory is a bar to political union, only as it renders communications slow and difficult; and that with the rapid and easy means of intercourse which the rail-way affords, New York, New Orleans, and Colombia river, though distant, respectively, from two thousand to three thousand miles, will be politically and morally nearer to one another than London and Edinburgh were a century ago. Free governments, in ancient times, were necessarily small, because they depend on union of sentiment, in the mass of the people; and one citizen would not then know the opinion of another at thirty miles distance. But the post, the press, and the stage coach, have made it easier to unite twenty millions of men in a common cause, in our days, than it was to unite the fiftieth part of the number in the days of Philip of Macedon. And with the means of com-munication, we are likely soon to possess, we think, the one hundred and fifty millions who will inhabit North America, next century, will be more completely one people, than the inhabitants of France or Britain at this day. It is pleasing indeed to think, that at the moment when the githe upper tunnel 3266, by the lower do. 2700 feet

Distance 436 miles. creating new, moral, and mechanical powers to cement, and bind their vast and distant members together, and to give the human race the benefits of a more extended and perfect civilization. But we ought not to overlook the additional security, which an opulent and highly improved country will in future derive from the facility of its internal means of communication. Were a foreign enemy, for instance, to invade England, 500 steam wagons could convey 50,000 armed men in one day to the point assailed; and within one week, it would be easy by the same means, to collect two or three hundred thousand men to one

From the Farmer's Journal.

ON STORING MANGEL WURTZEL.

Surrey, Oct. 15, 1824.

Sir,-Not perceiving that any of your correspondents has given to your inquirer Mm. (in your Journal of Sept. 27) any answer as to the cheapest and best mode of storing mangel wurtzel, (your LISH PAPERS RECEIVED AT THE OFFICE OF THE correspondent in the Journal of the 11th inst. having only stated the proper mode of stacking it in yards, when carted home,) I take the liberty of detailing to you a mode which I have found cheap and effectual for storing a crop, grown at the distance of two miles from my homestead. in a light, mellow, sandy soil. Whether the same mode would equally succeed in a stiff clay,

In the month of November, I caused my mancilities for rapid motion, for which it will afford, gel wurtzel roots to be drawn; the persons em-THE SILK WORM.

The other ruffian escaped be made of proper materials is within the reach the sales within that short time have been 22800 of every one :- Heat a knife, and plunge it in the bags of all sorts: the demand continues good, and Thursday, the annual sermon was preached at loaf: if the blade, when drawn out, appear bright, the advance above stated is readily obtained.—

From the above facts, it may reasonably be pre- for the superiority between the Short-horned and sumed that our present prices, which are fully 3d. per lb. higher than in September, will be maintained. The following is a statement showing the consumption of each description of Cotton per week during the year 1824, viz :-

American, 7350 bs. p. wk. are 382200 bs. pr. ann. Brazil, 148200 2850 East India, 640 33280 Other sorts,820 42640

11660 bags pr. week 606320 bs. pr. ann.

Kentucky Leaf, 1684 do. Stemmed, and about 170 made by the Judges. of other sorts. The stock remaining on hand here is 9250 hhds. against 11000; in London, 14750 against 17000, and in the rest of the kingdom 5300 against 4100 in December, 1823: the import during the past year has fallen off considerably, having been 70000 hhds. against 95800 in 1823.

Ashes.—The import of American Ashes in 1824 has been 33500 barrels. The stock on hand is estimated at 730 barrels of United States Pots, and 1420 do. Pearls, and of 12970 Montreal Pots, and 4980 do. Pearls, being an increase of stock of about 1700 barrels over that at the close of the preceding year: the consumption has greatly increased, in consequence of the additional duty on Barrilla, having been 31900 barrels in 1824, which is more by 9000 barrels than were consumed the year before.

Bark .- The import of this article has been 2800 casks, and the stock consists of 1570 Philadelphia and 890 casks of New-York.

and barrels, and of Flaxseed nearly 10,000 hhds. A Heifer, 5 years old, fed by Barney. Net &c. and Tuition, in any of the branches except of the letter nearly 2000 including 1000 letter nearly 2000 letter of the latter nearly 2000, including 1300 left over than was ever before obtained from a heifer of bundled and for an analy of the United States of the Languages, per annum, payable quarterly, one from last year.

The import of Flour has been very heavy, viz 83,750 barrels, of which nearly 40,000 remain, and fed by Barney. Net Beef 1397 lbs. of these not more than 12,500 barrels are sweet: there has not been much doing in this article of late, but none can be bought under my highest quotations, which are 8s. a 9s. lower than in December, 1823.

crease, is less by 400 casks than at the same period last year, and prices nearly the same.

during the past year, has been greater than at any former period: in Liverpool alone it has amounted to 102,000 barrels, and exceeds that of 1823 by 32,000, and in consequence prices have declined since April full 3s. per cwt.; the con-sumption has increased about 8500 barrels; but the stock on hand is so large (41,000 bbls. against 14,000 in 1823) that there is not much probability during the quarter commencing on the first Monof any material improvement in price. Of the day in October, 1824; ending on the first Monabove stock, 8000 barrels are held on speculation, day in January, 1825. and the remainder is in the hands of importers.

The import of Tar from the United States has been 15,200 bbls, of which there are only 2000 remaining; we have not received any lately, and the first arrival will probably command full prices. I remain, respectfully, your obedient serv't, ARCHIBALD GRACIE, Jr.

SWEEPSTAKES and SUBSCRIPTIONS have already been entered into, to be decided at the Exhibition in December, 1824.

AGRICULTURE.

PREMIUMS-offered by the Maryland Agricul-Exhibition to be held at the Maryland Tavern, in June, 1826.

A List of the Premiums to be distributed at will be found in number 47, page 371, of the Far-been cleared, and under cultivation; how culti-mer, of the 11th of last month.* It will be observed, that those premiums are chiefly for domestinctly, that premiums similar to those which have been offered for distribution in next June, are also offered for June, 1826. In addition to which, the Trustees offer the following for distribution in June, 1826, relating, chiefly, to FARMS and CROPS, to wit:-

For the Farm of not less than 100 acres, which shall appear to have been cultivated with the greatest economy and nett profit, consistently with its permanent improvement, reference being had to its natural advantages as to soil, situation, &c. a premium of

CROPS.

For the best 20 contiguous acres of wheat, to be not less than SO bushels per acre, For the best 20 contiguous acres of Indian corn,

yield not less than 60 do. For the best 20 do. rye, not less than 35 bush-

For the best 10 do. hay of timothy, clover, rye, or orchard grass, or any of the above mixed; weight to be ascertained at least one month after cutting,

For the best 10 do. wheat, yield not less than 12 30 bushels per acre,

For the best 10 do. Indian corn, yield not less than 60 bushels per acre,

For the best 10 do. rye, as above, yield not less than 35 do. For the best 5 do. hay, as above, 10

For the best crop of tobacco, not less than five hogsheads, highest price, 20

For the second best, do. do. To the person who shall raise the greatest quantity of seed cotton within this State,

For the best acre of potatoes, not less than 250 bushels. 10

For the best acre of carrots, not less than 400 bushels per acre,

For the best acre of mangel wurtzel, not less than 800 bushels per acre,

For the best acre of ruta baga, not less than To the proprietor of the apple orchard, con-

sisting of not less than 200 trees, who shall evince the most judicious management,

For the most successful experiment in waterrotting, or otherwise preparing flax or hemp; the quantity to be not less than 50 lbs. the whole process to be stated,

*The premium offered for best grass fed bullock in June next, was inserted by mistake. It had been proposed for October, but the time being altered the object is unsuitable, and is to be considered as erased from the list .- Editor.

Philadelphia, March 3d, 1824.

To the Editor of the American Farmer. Dear Sir, -I send you herewith, evidence of the produce of a given number of acres of land, Erie, 7th Dec. 1824, VOL. 6.-51.

in wheat and corn, in Erie Co. Pennsylvania .-The product in corn is good, if it is not great, and that in wheat is unquestionably very extraortural Society, to be distributed at the Annual dinary.—So much, in my opinion, that when I received the certificate thereof, I deemed it proper to write to a friend who resides in Erie Co. requesting him to procure, and transmit me pre- PEACH TREES AND DRYING OF FRUITS. cise information, as to the kind of soil upon which John HARE POWEL, Esq. Corresponding Secrethe exhibition in June next—that is, June, 1825, it was grown; the length of time the land had vated, and in what, immediately previous to its being seeded down in wheat, &c. The desi red tic animals and for household manufactures, and information has been cheerfully communicated, some other objects and things for which prepara- and I now put you in possession of the facts, to be tion may be made prior to June next; but, as used as you may think proper, and will only add, crops cannot be gathered before that time, the that the parties are personally known to me, and premiums for them will not be distributed until June of 1826. It will be understood then, disconfidence.

> Very respectfully yours, C. IRVINE.

Sir,-Your letter of the 30th December last, me some time since, with a request that I would made of pieces of an old tin waterspout, eight or reply to it, which I have not been able to do until the present time. I have made particular inquiry of Mr. C. J. Reed, respecting his field of wheat harvested in 1823; the result is as follows:

The land was originally covered with oak, chesnut, sugar maple, black walnut, &c. was cleared. nut, sugar maple, black walnut, &c. was cleared For the second best do. particulars as above, 30 in 1797, has been improved ever since; the soil, pailed together places, so as to be readily a mixture of slaty gravel with loam, resting on a bed of clay; in 1818, 19, 20, and 21, in clover; fore the insect attains the fly state; and every some constant and every and every some constant and every attains the fly state; and every attains a few to phostic angles, so as to be readily nailed together when placed around the tree.—

These boxes are filled the latter part of June before the insect attains the fly state; and every sowed with peas; after the crop of peas was taken autumn after it has disappeared, they should be off, 200 loads good stable manure, with cart and will concern sand withdrawn from them, which four oxen, hauled on to the field, the whole containing about three acres; ploughed it about the commended; but for oxen may be confidently re-15th August 7 inches deep, inclusive of the manure, lay about one week, then harrowed with a heavy harrow, and about the 6th Sept. sowed 21 bushels per acre, and ploughed it with a light they plant the peach trees in what they call a plough and harrowed; the two acres were accurring and harrowed; the two acres were accurring plough and harrowed; the two acres were accurring plough and harrowed; the two acres were accurring plough and harrowed; the accurrence surveyor. Maj. D. McNair.

Erie, 8th Dec. 1824.

land, 1124 bushele good sound corn, on my farm strips of wood similar to common plastering lath; in Harbour Creek township, Erie county, the in these drawers were placed the peaches cut in present year.

JOHN SHADDUCK.

HORTICULTURE.

FOR THE AMERICAN FARMER.

ON THE CULTIVATION OF

tary of Pennsylvania Agricultural Society.

Sir,-Of the various modes prescribed for preserving the Peach Tree from the ruinous depredation of insects, there is, I believe, none so effectual as that of surrounding the body of the tree, for several inches above the root, with either straw, tobacco, raw hide, or some other substance, that will prevent the fly from depositing its egg in the situation most favourable to its developement, which is the trunk just at the surface of the ground. One of my neighbours, an intelligent and ingenious horticulturist, uses sand as a protection, and has succeeded completely in preserving his trees in fine order: over the young ones, he drew tubes commended; but for extensive cultivation it is too troublesome. The experience of the New-Jersey farmers, who supply our market so provegetables for market, and it is constantly under tillage; in the spring of the year they carefully ridge up the sand as high as can be done with the plough, and in the autumn by throwing a furrow from them they again reduce it to its ordinary level. If during the summer by the appearance of gum around the stem, or other indications with which they are perfectly familiar, they suspect pense of 10 or 12 cents, by a young tree of the most valuable varieties, that will become bearing most delicious fruit. Our next care should be to preserve a portion of these for winter use, by drying them in the most perfect manner, and a reform in this particular is much wanted; those dried in a kiln are very liable to be burned, and exposed to the open air they become injured by I certify, that I raised on a field, containing dust, rain, and insects; the neatest, most econofrom their proximity to the ocean; he built of very rough materials a small house, inclosing a common stove, surrounded by shallow drawers opening on the outside of the building; the bot-This may certify, that I raised on one acre of toms of these drawers were composed of narrow half, the stones taken out, with the skin downwards; by means of a moderate fire in the stove, the fruit was gradually and effectually cured-it

supposed to know so much on this subject as the healed; and in place of a "slovenly" orchard, author of the piece on "Pruning Fruit Trees" your trees will always present a handsome and does ;-but I own some trees, and occasionally at- neat appearance. tend to their cultivation. From his observations
I am led to think that the writer has not expressed himself with sufficient clearness on the sub roots can nourish, is a beneficial practice, inasject, or that he has not attended much to the much as the superfluous ones will die, and become physiology of plants. I am induced to make these hard, and thereby preserve the tree from decay, remarks, because I have long seen with regret is, I confess, a novel one. A dead limb is a dethe errors which farmers in general run into, in cayed limb, and unless removed at once close to their system of pruning, and especially in the body of the tree, or branch from whence it season generally adopted in this neighbourhood proceeds, will communicate its disease to the for this operation.

rations in February, as many do—but recommends should always be made on sound and healthy wood, March and April. I apprehend that different and close to the body of the branch from whence sorts of trees require to be pruned at different it proceeds, that is to be cut off. In this case the seasons of the year. Pear stocks will better bear wound heals by the return of the sap, but in the pruning in February, than apple stocks will in other case it can never heal, as there is no vital March, because the wood of the latter is much principle in the part wounded. The reason why more susceptible to the effects of wet and frost most trees should not be pruned after the middle

the same building, having an open work bottom into a state of fermentation than those of the ject to peal off, not that it does not heal as quick similar to the drawers; here they become fit for pear tree; hence arises the more rapid decay of the market; and if at any time damp weather the apple tree when exposed to moisture and should render it necessary, a little fire in the should render it necessary, a little fire in the they should never be pruned, in this climate, be-to the aburnum, (sap-wood) from the stock or peaches were of a very superior quality, and I fore April, and it would be still better never to stem of four apple trees of equal vigour; -one have no doubt if this plan were adopted by those who have extensive orchards, they would command a ready sale and good price. The mode cover its wound, if it be not too large, without of equal size, the one cut in June will be covered adopted in France of preparing dried preserves, injury to the tree, the first season; whereas, if first with the new alburnum. The cut must not if practised here would be likely to well repay pruned in March, the wood will have been frost- run into the alburnum of the preceding year in any individual that would undertake it; it is sim. ed, and incipient decay will have taken place beneither case; and to try the experiment fairly, ply to make a syrup with 1 lb. of sugar to 3 quarts fore the wound is protected by the mild season, the cut ought to be 4 to 5 inches long, and 2 to 3 of water, in which the fruit must boil a few minutes, after having been previously pared; they to keep out the water. The writer on this submust then be drained on broad dishes, laying sing-ly; after the bread is taken out of the oven the fruit may be put in and left till it is cold; these, when sufficiently dried, packed up in neat little boxes, would supply a domestic article for our the inclemency of the season, besides the other season of the year, and caused the rot. By this tables, in place of the foreign luxuries of figs, evils attending it when performed even in May. we are to suppose that the upper branches were prunes, raisins, &c.; rescue our valuable fruit The head of a tree is proportioned to the strength left on the trees. If that were the fact, I do not from the distillery; add to our stock of innocent and vigour of its roots, and these are vigorous in understand how the ascent of the sap was stopped, indulgencies, and open a new source of profit to proportion to the quality of the soil from which unless there were so many limbs suppressed that they are fed. Some soils will furnish abundance the remaining few could not take up the sap furof nutriment to a pear tree, while they will supply nished by the roots. The upright or vertical an apple tree with feeble nourishment; and dit-branches of a tree take a greater portion of the ferent sorts of pears acquire different degrees of sap than the lateral or horizontal branches do, nourishment from the same soil. This principle and, generally speaking, the upper branches are is well understood by scientific farmers, and leads the most vertical. So far therefore, from stopto a rotation of crops, &c.

the fact in the strength and vigour of its branch-Mr. Fessenden,-In your paper of this day, I es; its roots will furnish a certain quantity of handsome fruit; you keep your trees in good I am no farmer, Sir, and therefore cannot be health; the wounds made in pruning are easily

mother branch, from whence it springs. This The writer has not, to be sure, begun his ope-lidea is so far from being correct, that pruning than the former; the juices of the apple tree of May is, (as you very properly state in your Journal of the Massachusetts Society, there ap-

was then thrown in bulk into a small loft within are more acrid, and are much more easily brought | note to this article) because the bark is then sub-

ping the ascent of the sap, by cutting off the lower, and leaving the upper branches, I should If a tree, therefore, be placed in a soil which lower, and leaving the upper branches, I should is congenial to its growth, it will soon show say that this act would accelerate the ascent, as there are no longer any lateral branches to divert it from its natural course. If you head a tree down, you check the upward course of the sap, until it finds vent through the tender bark which remains on the body or stem of the tree, and forms new boughs or shoots; but you do not prevent the ascent of the sap by taking away the lower branches, and leaving the upper dry. It is true, that if you cut off all the branches from a vigorous apple tree, in the spring of the year, the sap is returned back on the stock in such quanbranches, so as to consume it, the bark of the tree is forced off and decays, owing to the fermentation which takes place, or perhaps from

As I have already extended this article much beyond what I had intended to do, I shall not notice the seasons or the manner, which I esteem most suitable for pruning. Trees, which bear the stone fruits, as these trees are subject to gum, require a different treatment.

I must now, Sir, ask your pardon for calling on your patience and indulgence, while you read this long and tedious notice of your correspondent's remarks on the "Pruning of Fruit Trees;" but I consider it important that a work like yours, which contains so many excellent remarks and useful hints on the subject of agriculture, should not propagate erroneous notions, when it is in-tended to promote correct views of this most important science, as well as that of its twin sister

upon the subject of Peach Trees, mentioning ticles sent by the same maker. their decline for some years past, and the various remedies employed by him for relieving their appear that the peach trees in the neighbourhood of Boston, are subject to the same disorders; but as the Society have thought proper to publish this paper for the benefit of their members, and other readers in their districts, it must be presumed that the subject of it was considered worthy trees there, are also more or less affected by casualties or distempers, which it was their desire to remove or prevent. Under this impression, I shall proceed to state an expedient which has been applied to the improvement of fruit trees in this country, and which may be equally serviceable in other portions of the country.

The peach trees here appear to be liable to the ced same disasters and diseases which are described by Mr. Peters, and they often wither and decay trees are also frequently affected, and sometimes hood some years ago, observing the situation of his trees, and having unsuccessfully used many applications, at length directed their trunks or bodies to be washed, and well rubbed with soft soap; and it is not easy to imagine the early change which appeared in their bark and foliage: the bark became smooth and glossy, and seemed sound and beautiful; and he thought the tree was greatly improved in every respect. I have tried the same experiment, and with equal advantage to apple trees, pear trees, and peach trees, and am persuaded they have been greatly benefitted by this process; it is used in the spring, and may be repeated in following years as frequently as the trees appear to require it.

Mr. Peters declares that he used soap suds blue ore)-A gold medal. without any beneficial effects; but it is probable that the soft soap in substance is more powerful, and, that having more strength and virtue than the suds as commonly made, it may more effectually destroy the worms, bugs, and other insects which so materially injure the trees; and it is bethat the bark and branches are enabled to derive so much improvement from the application of this substance.

I am about to suggest this expedient to Mr. Peof your Society, you are at liberty to place this communication before them.

Yours, &c.

N. HAMMOND.

Domestic Manufactures.

PREMIUMS OFFERED BY THE FRANK-LIN INSTITUTE, AT PHILADELPHIA.

(Concluded from our last.)

- 51. To the person who shall have produced and silver medal. reeled, during the year ending Oct. 1, 1825, in Pennsylvania, the greatest quantity of raw silk, not less than ten pounds-A silver medal,
- 52. To the manufacturer of the best specimen zing, and no premium granted unless the speci- dal. mens be equal to the best imported.

Flax dressed in this manner is much stronger, small recommendation.

83. To the maker of a hydrant that shall be and suffers less waste than when the common method is used. The machine now constructed, is only of half the intended size; but is able, with ON HORSE MILLS-being an answer to the the work of a man and a boy, to break about 400 pounds in a day. The inventor is satisfied that one of full power, and with the same labour, would dress 1000 to 1300 pounds in that time.

The bleaching is effected by another process,

and still without resorting to acids or corrosives; and this is prepared for manufacturing.

A machine of half size cost about \$120, and may also be applied to the breaking of hemp; and canvass for sails, as well as every other fabric prepared and manufactured in this manner, will be found much more durable than any other.

From this description it will be seen, that Mr. Roumage's invention promises a most important advantage to agriculture and manufactures, if he having mislaid the papers, it was not then prac-should be as successful as he expects, he will have accomplished what has long been consider-

CULTIVATION OF FLAX.

It will be recollected that we sometime since ed, for the best acre of flax made in Maryland, took notice of a Flax Machine, invented by Mr. Roumage, together with his new process of bleaching, &c. (See the Daily Advertiser of Sept. 18th.) ration. The fibre was remarkably long, firm, and various dyes very rich and various. These specimens were exhibited at the fair in New York, as by a water power. As large and heavy stones tended for that species of manufacture. Roumage has given us the following brief hints on the best mode of cultivating flax, which we are induced to publish, by the hope that they may prove useful, and we wish they may find an

I am persuaded this machine may be made to burnt, and the ashes will be found a valuable marginery.

Three or four horses applying their power in the purpose, and it is the only one I ever well calculated to prepare it for being work.

FOR THE AMERICAN FARMER.

enquiry of Major Thos. Griffin, of York-town, Virginia.

Mr. Skinner,-On the last rainy day (which I spent, as I usually do those unfitted for the labours of the field,) turning over the leaves of one of the volumes of the Farmer, the enquiry of Thomas Griffin, of York-town, for information of a machine moved by horse power for grinding corn, met my eye, and with it came the recollection that no public reply had ever been made to it .-Myself, under personal obligations to Maj. Griffin, for his politeness in pointing out to a perfect stranger, the scenes of the military operations which closed the great drama of the revolution; and the agricultural community under still greater obligations, for his contributions to the knowledge of their art, doubly impose on me the duty of doing what, I well know, others are much better able to perform. Nor have I seen any answer to an enquiry from another correspondent, respecting the portable mills formerly used in the French armies. Though I cannot give very specific information of horse mill machinery, I may inspire the curiosity to search for it at the proper sources. Of the French mills, I have seen two, and as some body may be gratified thereby, I will tell what I know concerning them.

As to a mode of grinding corn there is none other equal to the old fashioned one of a pair of stones, which, with proper machinery, can be put into effective operation, by a horse power, with as much advantage, all circumstances considered, Nov. 16th and 18th, and received the premium in only can make meal, either good, or expeditious-Mr. ly, a proportionate impelling power of any kind

must be applied.

The common objection to all horse machinery on a small scale is, that its movements are unsteady. This is a great fault in a corn mill, and "My friend, Mr. Craig, will send you a bundle extensive circulation through other papers in all can never fail to make bad meal. One horse, and of Flax, prepared in different ways.—It is not parts of the country, where the subject to which that a mill horse, (proverbial for his qualities) always moves irregularly. His time is divided Cultivation of Flax.—The land intended for between standing still, faultering, and starting the raising of flax, should be well prepared in the under the lash. Hence, irregular deposites of

> divided portions, say to two or more beams, or levers, move steadily: the halting or faultering

of one does not affect the rest.

A common fault in the construction of horse bad work is done, and the animals are injured .-I have seen them travel in a circle of 16 feet diseed is sufficient for an acre of good land; and a ameter. Twenty four feet is little enough, but 30 is much better, and doubtless 36 is preferable to either. Horse power is better applied by their draught than by their weight.

All the machinery of horse mills are too often ter harrowing, the seed must be sown as uniform-on a scale so contracted as to give an unnecessary ly as possible, and then passed lightly with a and undue degree of friction. This is usually the harrow, or brushed in, but should not be covered effect of an ill judged parsimony. What are the proper dimensions and relative properties of the different wheels, I would not here say, were this

A well constructed horse mill moved by four corn in an hour. Two hours of any rainy day in By observing these rules, the flax will be found the week, will provide meal for a family of forty seed will be all preserved, which is of itself no all the machinery, not exceeding 300 dollars, and the same machinery at the same time capable of

and, perhaps, a whole neighbourhood with a mill makers, for very good reasons as concerns themare sufficient for the cotton gin, corn pounders, hints receive the attention they deserve.

As to mill ponds, they are next to whiskey and militia musters, the greatest nuisances that in fest our country. Some of our counties that nature intended to be healthy, have been, by the perverted industry of man, rendered the favoured abodes of misery and disease. I know a phy- EXPERIMENTS WITH STEVENS' PLOUGH sician, who, looking for an eligible place to practice in, counted the numbers and estimated the expense of the mill ponds which lay in his route, and finally located himself in the midst of a dozen. But even money may be bought at too dear a rate; for, while his neighbours are dying of fevers to his great emolument, he has not been able to save himself from a terrible liver complaint.

I have, as I said before, seen machinery, where grinding, picking cotton, threshing, and beating corn on the cob, were all performed by one wheel, but not all at the same time, yet power enough might be applied to effect all this at once, though cotton gin, 60, and corn beaters, 15 dollars.

As to the French army mills they resemble a two crank handles, for as many sans cullottes to meal, and might for their wholesome discipline be substituted for the tread mill. In constant use they wear out in two or three months, and being of cast iron, cannot be sharpened as the old fash-W. F. F. ioned coffee mills can.

Yours respectfully, JAMES WILLIAMS.

Internal Improvements.

The following Message was received from the President of the United States.

TO THE SENATE OF THE UNITED STATES :-I herewith transmit a report from the Secretary of War, with a report to him by the chief engineers, of the examination which has been made by the board of engineers for internal improvement, in obedience to their instructions, of the country between the Potomac and the Ohio rivers, between the Ohio rivers and lake Erie, between the Alleghany and Schuylkill rivers, the Delaware and the Rariton, between Buzzard's and Barnstable bays, and the Naragansett roads and Boston harbor, with explanatory observations on each route. From the view which I have taken of these reports, I contemplate results of incalculable advantage to our union, because I see in them the most satisfactory proof, that certain impediments, which had a tendency to embarrass the intercourse between some of its most important sections, may be removed, without serious difficulty, and that facilities may be afforded, in money, in harmony with the states to be affected by them, having already communicated my senti-

Washington, Feb. 14, 1825.

ting to this department the proceedings of the of the mould-board from the first mentioned, and board of engineers for internal improvement, unbearing a resemblance to that of Stevens'; the der the act of congress, passed April 30, 1824, authorizing the executive to cause to be procured the necessary surveys, plans and estimates upon The ground on which these trials were made, the subject of roads and canals. The reports are had been, the year preceding, sown in oats, and very full and in detail. The board have reported not having been stirred since the crop was sown, favourably as to the practicability of passing the a pretty stiff bed of Blue grass, Daisy, Sorrel, summit level between the waters of the Potomac &c. appeared all over the land. The soil, 3 or 4 and the Ohio, by means of a canal, and that it inches, below the surface, is a clayey loam; the may be effected at a small expense, compared substratum consists chiefly of yellow clay; the with the advantages expected to result from its view.

I have the honour to be, very respectfully, sir, your obedient servant,

J. C. CALHOUN. To the President of the United States.

The following is the report of the members of the board of internal improvement :-

Washington City, Feb. 3, 1825.

Sir,-The board of internal improvement have the honour to transmit two reports on the proposed canal communications between the tide-water of the Potomac and the Ohio river; between the Ohio and lake Erie; between the Alleghany and Schuylkill, or tide-water of the Susquehannah; between the Delaware and the Rariton; between Buzzard's and Barnstable bays; and between Naragansett roads and Boston harbor. Accompanyng these reports will be found a letter from Dr. Howard, on his reconnoisance of the country south of the Glades; a memoir on the part of the Alleghany river; a memoir by each of the and according to my own costly experience, use culations are right, that there is the great differ- chiefs of brigade, viz: maj. Abert, capt. McNeill ed, of which the following is a list :-

No. 1. Survey of part of the route of the Potomac canal, in 1824, by J. J. Abert, major and T. E. assisted by lieutenants Swift, Macomb, Bennett, Long and Wilson.

2. Maps of the eastern section of the summit le. vel of the Chesapeake and Ohio canal.

3. Profiles attached to capt. McNeill's map of the summit level, numbered 2.

4. Profiles attached to capt. McNeill's map of the summit level, numbered 2.

Dillahunty; a copy of the records of the board Potomac and those of the Youghagany, a branch other gentlemen attached to the service, have in relation to the Ohio and lake Erie canal routes, of the Monongahela, the board prepared instruc- fulfilled their duties to the extent which the time and nineteen maps, general and particular, of the tions for the preliminary surveys and measureseveral sections of country explored and survey- ments to be executed by the topographical engi- finished parts of their instructions comprehend neers, and other officers and gentlemen attached the eastern section of the Ohio and Chesapeake for this service, and having now maturely consid-canal, from Cumberland to tide, some lines on the ered the circumstances observed by them personally, and carefully studied the results of such of these preliminary surveys as are completed, they are decidedly of opinion that this communication is practicable.

The board, on viewing the country between the veyed by Wm. Gibbs McNeill capt. U. S toph. Ohio and Lake Erie, along various lines indicated veyed by Wm. Gibbs McNeill capt. U. S. toph. Ohio and Lake Erie, along various lines indicated eng.; lieutenants Lewis G. D. Russey, Wm. by public opinion, became possessed of such facts as place the practicability of canalling, from the Dillahunty, John M. Fessenden, W. G. Williams.

McNeill's map of Lake Erie, beyond all doubt. The information lake Erie, beyond all doubt. The information was the the beard is not however, of a national content of the collected by the board, is not, however, of a nature to enable them to decide which of the several routes deserves a preference; and a definitive choice can only be made after the several surveys, indicated by the extract from the record of the board, herewith, shall have been executed.

In further execution of orders, the board repaired to the state of Massachusetts, and viewed the ground between Buzzard's and Barnstable bays, where the isthmus of Cape Cod is not only narrow, but so low, compared with the adjacent ly, at private expense, the board are of opinion this canal might be opened at least as deep as low water, at no extraordinary cost. The tide rising

munication to be practicable.

In execution of the orders of the secretary of war, requiring a co-operation with the canal comexamined the whole route of the proposed canal from the Alleghany to the Schuylkill.

From observations made by the board along lake Erie, showing the proposed route of the this line, and from surveys and levellings since made by the Pennsylvania commissioners, the board are inclined to believe in the possibility of this work; but they think that further investigations are necessary to the definitive settlement of the severity of the weather.

The co operation of the board with the comthe Rariton, by leading the water of the former, are cut off the better, it prevents their growing from about twenty six miles above the city of in the pits. Trenton, to the summit ground between Trenton mensions adapted to the vessels navigating the steamboat navigation of the Ohio, and between great rivers and bays of the sea-coast. The board have been accustomed to sow them broadcast, the Ohio and Lake Erie, for the purpose of as- are, however, of opinion that, previous to fixing certaining the practicability of a communication the exact route of the canal, lines should be run from the vicinity of Bordentown across the summit, to the lowest point on the Rariton, to which a canal can, with due economy, be extended, with ing far too costly, unless used on a large scale? the board proceeded from the seat of government, a view to avoid as much of the difficult tide navigation of the two rivers as possible.

and the season of the year permitted. The unsummit, and the whole western section.

We have the honour to be, very respectfully,

your obedient servants,
G. TOTTEN, Maj. eng. brev't. lt. col.

S. BERNARD, Brig. gen. Members of the board of internal improvement. JNO. L. SULLIVAN.

To brev't. maj. gen. Alex. Macomb, Col. commandant U. S. engineers.

MISCELLANEOUS ITEMS, FROM LATE ENG-LISH PAPERS RECEIVED AT THE OFFICE OF THE AMERICAN FARMER.

> From the Farmers' Journal. PRESERVING CARROTS, &c.

> > Near Northampton, Nov. 16, 1824.

Sir,-In your Journal of Oct. 18th, there is the following inquiry, dated Essex, Oct. 12th, 1824, with the signature of T .- " What is the best way country, as to have attracted public attention to of preserving carrots for winter, and what will it 9. Plan of a proposed summit level of the Ohio this improvement, at an early period. Aided by cost per bushel, or per acre, to take them up and Chesapeake canal, between the little Youg- the maps and reports heretofore made of this from sandy land, where the root is large and plant hagany and Crabtree creek, by Mr. Howard, ground, at the public expense, and by maps and thin?" As I have not seen any answer to the inground, at the public expense, and by maps and thin?" As I have not seen any answer to the ininvestigations which had been made more recent- quiry, if you think the following information worth insertion in your Journal, it is at T's service. Having repeatedly grown carrots, I have tried several ways of storing them, and have had great from eight or ten feet on the Barnstable side, this depth of water might be carried through the canal. The locks on the Barnstable side to be prohave been very successful: The plan I have adopted, (though it may not be the best,) is the The board also made a reconnoisance of the best I have ever tried, which is, to put them in ground between Narragansett bay and Boston small pits, not more than three feet wide at the barbour-likewise with the advantage of know. top of the ground, sloped to two feet wide at the ing the result of previous surveys, under the au-thority of the state government, whence they in fer, that further investigation may show this comlarly stacked,) then throw a quantity of the sandy earth in amongst the carrots; then more carrots, then more earth; then heap the carrots on missioners of the state of Pennsylvania, the board till the ridge is about eighteen inches above the ground; then cover them with a bolting of long wheat straw, and lay a quantity of earth over the whole; beat it with a spade to keep the wet out. The earth running in amongst the carrots pre-vents their heating. Mine have kept very bright till late in the spring, and by having them in small

THE GANDER OF ARBIGLAND.

Among the many rural appendages of Arbigland, there happened, a good many years ago, to be a fine old gander, who had lived from youth to age in the same delightful spot, and whose remarkable, though well authenticated exploits, are well worthy of being recorded. From the great age and superior sagacity of this bird, he had become a great favourite with the former proprietor of Arbigland, who used to take much pleasure in "Far as the Solar Walk or Milky-way,"

&c. was a Scotchman, and I expect he drew up come so numerous, that the poor old gander was In this age of science, we may fairly expect soon the articles. "To the ploughman driving two left without a single helpmate—a misfortune to find milkmen with F. R. S. appended to their which he deplored day and night by many a dole names, and cheesemongers and tapsters, whoful and sorrowful note. These affectionate repinings did not escape the observation of Mr. Craik's servants, and orders had just been issued for re be procured, and inserted in your truly valuable placing the extirpated breed of geese, when the willowed biped suddenly disappeared, to the great regret f the whole family. One blamed the fox, another the foul mart, and a third the gipsies; but the event proved that they were all mistak n; to get cold, a few words upon the subject will for, one morning, as Mr. Craik was entering the breakfast parlour, he heard a well-known cackle, and immediately exclaimed "If the old Stag had rists of this neighbourhood, I feel greatly oblig-ed by the communications of your correspondents that was his cry." The call was immediately rerelative to the culture of mangel wurtzel, and peated, and on going out to the lawn, or on look-doubt not but that many more acres of this valuing out of the window, Mr. C. beheld the identical old gander, surrounded by a whole flock of In a journey that I made through Shropshire a bonny lady geese, whose approach he was thus few days past, I was much pleased and surprised proudly announcing, and whose wings were still to find how much Gen. Beatson's plan of burning dripping with the brine of that element, through clay was brought into practice, upon the cold which he had taught them to pilot their way for clays of that county; it is undoubtedly a plan that a distance of at least 12 or 15 miles. This singufurnishes a large quantity of excellent and active lar occurrence naturally excited a good deal of inmanure, at a very low price. Upon a large tract terest, and after making every inquiry, it appearof lately woodland, many of the fields had the ed that the gander had either been carried away lands burnt all round the heaps, and at a distance by the force of the tide, or had voluntarily swam appeared like immense bee-hives, or rather what to the opposite shore, where, landing on some of his drink. After having taken the warm drink, travellers describe as the huts of the white ants, English farm, he had immediately attached himor termites of Africa, each containing from twen- self to one of the owner's geese, and sojourne ty to thirty cart loads of well pulverized soil. with her, till she had hatched a pretty numerous Upon inquiry, I found that the expense of burn-brood. SOLDIER OF FAME.

A NATIONAL SONG-BY CAPTAIN R. T. SPENCE, OF THE NAVY.

The GOD of creation hath called forth the morn Auspiciously bright; by His sovereign decree All nature rejoices—the night that is gone Seemed impatient to usher the day we now see A day most sublime; for the light never broke To illumine a scene more transcendantly grand: It gives us the Chief, who, from Britain's stern yoke, With heroes departed, enfranchised our land.

Full of honors and years, he is spared by his Gon To visit the home of the happy once more; The path of his glory triumphantly trod, With Victory perch'd on the standard he bore, Invited, he comes, 'mid the shouts of the world,

The shouts of Ten Millions who gladden our clime-The "Star Spangled Banner" so proudly unfurl'd—
The page of his Glory immortal as Time.

Come forth, gallant freemen! come forth in you ry; Rush forward, rush forward, to greet our lov'd; Whose name and whose deeds are resplendant in swall, Of all living heroes, the purest, the best! Come forth, lovely Woman! come forth in your beauty, To the scene of enchantment, embellishment lead-Oh, you who are foremost in virtue and duty, Urge forward to wellcome a father and friend.

To the land of the free, a Hero is come, Whose glory will triumph o'er ages unborn; Till all that is mortal shall sink in the tomb; Till time shall be lost in eternity's dawn. Brave warrior of France, brave soldier of fame!

The Millions of Freemen who welcome thee here, With fondest devotion will hallow thy name While Virtue is valued, and Freedom is dear.

Ye worthies who slumber in Glory's bright grave, Who for honor, for country, for liberty bled-Your sons from the chains of a Despot to save, Before whom Oppression and Tyranny fled ;-Look down, sainted spirits! look down and approve The homsge we render to Gallia's brave son,
Who soon will be summoned to join ye above,
To receive the reward which his Virtues have won-

Ye sons of brave chiefs, to whose valor we owe The blessings which make us the pride of the earth, Remember the warrior who vanquish'd your foe, Who conquer'd to rescue the land of your birth-Remember this friend, for immense is your debt-Your freedom he won you, with treasure and toil-Can the brave be ungrateful, or ever forget The kind Benefactor who visits the soil?

1. Dung of Sea-birds .- One of the most powerful dungs is that of such sea-birds as feed on animal food. The naturally sterile plains of Peru are fertilized by guano, a species of dung collected from small islands in the South Sea, frequented by sea-birds. It is used over a great extent of South America, applied in very small quantities, and chiefly for crops of maize.

this country as a manure until a trial of it was ges, which are surrounded with gardens and pro made in Wales, at the recommendation of Sir H. digious numbers of pigeon-houses. On inquiry I sibly one cause of the cow-dung being prejudicial, Davy; in which instance it produced a powerful found that these birds are kept principally for the land is not stated; but possibly one cause of the cow-dung being prejudicial, was the natural coldness of the soil. Moreover, but transient effect on grasses. That sagacious, and candid experimentalist hence conjectures, that the rains in our climate materially injure that spe- han, is alone to be ascribed to this rich manure cies of manure, unless where it happens to be The largest of the pigeon towers will sell for mented with other dung, or kept alone till it can

- 11. Turf dust . 1 bag 3 gallons.
- 12. Cow-dung . 1 bag 3 gallons.

On reviewing the two tables, we may perceive, that though the relative powers of the manures may vary a little, from accidental causes, yet the increase from the whole root, as tried against that from the eyes, with the same manure, is uniformly so much greater, as to prove decisively that it is more profitable to set either a half or whole root, than to plant eyes. The author of the experiments also informs us, that in digging up the potatoes, he found those produced from the eyes much smaller.

To the passage above quoted, Sir II. Davy sub-joins: "The question of the proper mode of the application of the dung of horses and cattle, however, properly belongs to the article of composite manures; for it is usually mixed in the farmyard with straw, offal, chaff, and various kinds of litter; and itself contains a large portion of fibrous vegetable matter."

7. Hog-dung-according to the comparative statement above, ranks immediately after sheepdung, and before horse-dung.

8. Urine .- All urine contains the essential elements of vegetables in a state of solution; but the various species of urine from different animals, differ in their constituents; and the urine of the same animal alters when any material change is made in its food. During the putrefaction of urine, the greatest part of the soluble vegetable matter contained in it is dissipated: it should consequent. ly be used as fresh as possible; but if not mixed with solid compost, it should be diluted with water; as when undiluted, it contains too much animal matter to form a proper fluid nutriment for absorption by the roots of plants. Putrid urine abounds in ammoniacal salts; and though less active than fresh urine, is a very powerful manure.*

* Elements of Agricultural Chemistry, p. 201.

FROM THE NEW ENGLAND FARMER.

A very valuable work has lately been published in Philadelpnia, entitled "Memoirs of the Pennsylvania Agricultural Society; with selections from the most approved authors, adapted to the use of the practical farmers of the United States, published by John S. Skinner, Esq. Editor of the American Farmer, Baltimore."* This work has received due and handsome notice in the last No. of the Massachusetts Agricultural Journal, which we proposed to re-publish in a future No. of the New-England Farmer. In the mean time, we have selected the following article for re-publication. It is written by a gentleman, who is not only one of our most intelligent Agriculturists, but whose character and station in society, will add the weight and mental improvement. of authority to the intrinsic value of his observations .- Edit. N. E. Farmer.

dian Corn-the advantages of Improved Shorthorn Cattle, for the Dairy and the Shambles.

[BY THE HON. LEVI LINCOLN.]

Worcester, August 3, 1824.

JOHN H. POWEL, Esq. Dear Sir,-I regret that absence from home, and the pressure of my engagements have so long delayed an acknowledgment of your letter of enquiry upon agricultural subjects, by the receipt of which I beg you to be assured I felt both obliged and honoured. If my ability to afford practical and satisfactory information was in any degree proportionate to the ardour of my feelings, and my sense of the importance of the object of our greater productiveness of labour,-I should more and my attention and observations frequently interrupted in a manner to preclude a very systematic account of its progress, present expense, or promise of future advantage; and I can speak with still less confidence of the experience of others. The present depressed prices of produce, and the high rate of wages in this part of the country, are unfavourable to any great improvements in agriculture. This disproportion is most unreasonably great. Until within a few years a bushel of rye would pay for a day's labour at hay-making, while now, the price of 2 bushels is hardly made satisfactory. The smith's count of expenses, is but little, if at all diminished. From this and other like circumstances, the business of husbandry is adversely affected. Less to believe that this habit of almost incessant labour harvest are usually employed in clearing new in the preparation of composts, and in the transportation of the barn yard manure to the field for use the next season. Providing fuel for the year, and the care of cattle, afford occupation for the winter. And I may well venture to say, that the prudent farmer can have no idle time. The general tone of morals, and the degree of information which is found to exist, evince a devotion of some leisure hours to the sources of intelligence

of Farm Labour in Massachusetts-breaking, it is thought, become more powerful by being feeding, and working Oxen-the culture of In-|sooner accustomed to each other, and to the application of their strength to the draft. I believe they may be taught to travel in almost any gait; certain it is, the rate at which oxen, differently broken, will walk with their load, would seem incredible to a person ignorant of the difference in the mode of their training. To accustom them to a quick pace, they should at first be driven in the yoke while young, without any, or a very light weight, and never heavily loaded, until they have arrived at full strength and maturity. A great fault with many people is too much indifference to the construction of the yoke. Almost any shapeless piece of wood, with holes for the insertion of the bows, is made to answer; but to the ease of the draft, the adaptation of the voke or bow to the neck of the bullock, of husbandry, and of its substantial results in the are altogether material. For common use, and deeply regret the little opportunity I have for particularly for ploughing, I have found that communication and correspondence on the subject. largest size require a voke from 41 to 5 feet in yokes were generally too short. Cartle of the My farming however, has necessarily from my length. In short yokes they are apt to haul as it situation, been but of secondary consideration, is termed, that is, draw from each other, and to such a degree in some instances, as to cross their fore legs, and destroy their power, and greatly impede their progress. I once owned a pair made totally useless by this habit, and afterwards entirely corrected by the application of a yoke of 18 inches more length. A short yoke is necessary only in snow paths, where cattle would otherwise crowd against each other, the opposite of hauling, but of the same mischievous effect. In respect to what oxen may be made to do in a short time, or as an experiment upon their strength, I must refer you to the results of our ploughing matches bushels is hardly made satisfactory. The smith's and trials of strength. With us they are but bills also, an important item in the farmer's account of averages is but little if at all diminished. tation of heavy loads for short distances in the same town, or between neighbouring towns. One labour than would be advantageously applied to the culture of the earth is engaged, fewer and more important implements and provided in the culture of the earth is engaged, fewer and the culture of the earth is engaged, fewer and the first the continuous that first the continuous that first the continuous travel quicker, and that first the continuous travel quicker and the continuous travel quicker an the culture of the earth is engaged, fewer and quicker, and that from the construction of the more imperfect implements are used, and a less hoof, they are less liable to lameness, than the careful and improving course of farming is pursued, than, I trust, we should otherwise and every other hand, the patient and steady labour of the where notice. Still, against all these discourage-ox finds no substitute in the horse for the service. ments, the agricultural interest in this neighbour-hood must be considered as progressive. Perhaps except in occasional aid of the ox team, or with ox finds no substitute in the horse for the service in no part of the country is there more industry, the light plough between the rows of corn. The more hours of time devoted to labour by the value of a yoke of oxen, or a pair of horses, for yeomanry, than in this county. They are early use in all the business of a farm admits of no risers, and generally at work in the longest days comparison. So decided is the preference for the before the sun, and with short intermissions for former, that I do not believe a single farmer can former, that I do not believe a single farmer can breakfast and dinner, until evening. I am inclined be found in this extensive agricultural country is somewhat peculiar to the proprietors of our while there are hundreds, I had almost said thousands who make no other use of horses in hus-sands, who make no other use of horses in huswho performs his labour by horses without oxen, vation and securing of the crops, and after the bandry, than to furrow for ploughing, and plough among their corn for hoeing. Our oxen also, to anlands for improvement, in the erection of walls, swer another part of your inquiry, are kept in a by which most farms are enclosed and divided, cheaper and less expensive manner than horses. In the summer they are uniformly grazed in the pastures. In the cold and winter seasons, they are ut into the barns, and fed upon the stock hay, as it s called, that which grows in meadows, and upon he fodder of corn stalks, husks, &c. unless indeed in our climate, and with our occasions for industry, they are more severely worked than usual, when hay of better quality is given them; and in all cases, as the spring advances, their keeping is improved, and with better hay, some grain is added. I speak of the general practice of farmers. There are some who keep their oxen more You enquire the mode of "breaking, feeding, generously, and others more hardily than I have and working our oxen." The best broken oxen mentioned But with a clean and warm stable, are those which are early trained and accustomed the daily application of the currycomb or card, *Who will deliver, free of other charges, any to the yoke with occasional light work.—They and coarse food, without severe labour, the best number of copies for \$1 50 each.—It is embellishare often broken as early as at one and two years farmers will at all times exhibit teams of most of age, with gentle and patient usage. 7. To bolster up prices he either has, or wish-

8. His agents pretend to have advanced him S10 per cantar, and FHINCILLE LACHERYME."

9. The consequence of such a system as long as it may last, is, that there is but one English es-

10. Muhammed Ali is fond of fostering his own manufactures-linens, silks, and cottons and printing establishments; likely, eventually, to prohibit French and British manufactures.

11. Specie sent to Egypt to purchase cotton has been returned.

12. The monopolizing price, and the heavy shipments, on account of the Pacha, makes it impossible to foresee what reduction the Mocho cotton may sustain in England; and whatever it may be, it can only be a nominal loss to the Pacha.

13. Proposals have been made for an improved system of cultivation and sale.

14. The Levant company is a nuisance.

15. British merchants are content with obso-

16. A merchant to be bastinadoed for examin-

To the Editor of the American Farmer.

Sir,-Accident brought before me Mr. Walsh's read the article he lauded so highly, and cannot say I was disappointed. It has confirmed me in degree, is well known by all who have any of the tained of the result of Muhammed Ali's operathe American Farmer the channel of its commu-

> It is evident the paper is written by some disappointed, soured supercargo, who, like the Editors of the Morning Chronicle, and some other papers, foster every thing like opposition and imposition; and, in fact, cannot see beyond his nose."

> To me, I repeat, it appears evident that, considering the power of Muhammed Ali, the alarm is founded. No one will deny to him understanding and intelligence; and combining a knowledge of his power with these qualities, I am apprehensive of the results.

> The writer allows there is now annually produced 200,000 bales, and that any greater quantity can be produced.

I refer you to the 12th paragraph for a fact pregnant with alarm. It will furnish its own comment.

I would ask the writer if, under such a man as Muhammed, it is likely affairs are to be stationary? On his own shewing, it is impossible for a chief who has cut the canals and opened the commerce, &c. &c. he has in so short a period of time, long to remain insensible to the advantages

of a free system of commerce. The writer has uttered some sage advice as to quality. The price (10d. to 12d.) it has borne in the Liverpool markets renders any observation on that head unnecessary.

Editorial Correspondence.

Extract of a letter, dated Frederick County, Va. 22d Feb. 1825.

To J. S. SKINNER, Esq.-

Dear Sir,-"I have never yet thanked you for the beautiful sample of Saxon wool, sent me last summer; for as I could give you no useful information on the subject of the tariff as it regards wool, I have postponed it until the present. I have lately sold my crop for 35 cents in exchange From LATE ENGLISH PAPERS RECEIVED AT THE for groceries in Winchester. The price with us certainly has not been raised as yet; but it is a fact that a more certain market is created, and in due time wool will be estimated according to its value, and not thrown into one common mass without discrimination and sold at one common price. Once sheep were my exclusive hobby, now they share in common with all my other stock; they are all so necessary to be perfected recently increased, and many young practitioners in their place, that I find undue partiality bad are making enquiry respecting the best way of economy. I believe it has been a ruinous thing storing them for the ensuing spring feed, perhaps to many farmers, that devotion to some one par- it will not be unacceptable to them to read the rest; perhaps, still more ruinous to a planter the they will then practice that which they best approfit increased with my pleasure in making hob- detailed account of his in your number of Octoa good farmer."

THOMAS HEROD.

Ali Pacha's Method of improving his Cooks .-"Pilau, or boiled rice, the usual desert of the Turks, and over which they pour curdled cream, being now served up, the Vizier, dipping in his spoon, discovered two or three small feathers .-He immediately judged that his pilau had been boiled in the water in which the under cooks steep the poultry previously to plucking it. 'At that instant,' says M. Pouqueville, 'I saw the Satrap turn pale, and immediately symptoms of alarm and terror seized his attendants.' is this? Ah!' His voice was completely altered, when, his eyes accidently meeting mine, not being able (I know not why) to continue his invective, he suddenly burst into a loud fit of laughter. 'You see, my son, how I am served; some day or other I certainly shall hang up a few of them.'deed it will—if you knew how essential it is to good order!'—' For this once I hope you will pardom them.'—' Yes, but they must eat the pilau boiled in the dish water with all the feathers in letter). 'But for you,' said he, 'their heads should be in my court-yard.' At this time there were about half a dozen exhibited there, previously to being sent to Constantinople."

[Life of Ali Pacha.

Useful Invention .- Thursday evening, much curiosity was excited about 9 o'clock, in the Strand, by the appearance of a gentleman on horseback, from whose feet streams of light issued forth, and showed the pavement for several yards before and round the head of his horse asclearly as in day-time. The light proceeded from a set of lamps of his invention, one of which was darkened, emitted in front a blaze, which was prevented by the rider's feet from rising to dazzle his eyes, and fell on the foreground with such power as to make every hollow or impediment visible, and render it as safe to ride in the darkest

Last Will and Testament of William Hunnis, Chappel Master to Queen Elizabeth, written on the back of the title to a copy of Sir Thomas Moore's works, 1557, in his own hand-writing. To God my soul I do bequeath, because is is his own:

My body to be layd in grave, where to my friends best known;

Executors I will not make, thereby great stryffe may grow;

Because the goods which I shall leave, wyll not pay W. HUNNIS. all I ow.

SINGULAR STAG HUNT .- Lord Derby's stag hounds met at Kenby Common, on Tuesday last, information, who, in his letter, in one of your the hounds being near at hand, got wind of him numbers in August last, contemplated ploughing before the usual time allowed for the deer to go height from the ground of thirty feet. JNO. C. MOORE, Inspector.

TREASURY OFFICE, ANNAPOLIS, Jan. 20, 1825. True Copy from the original report on file in Jno. S. Skinner, Esq. Corresponding Secretary of this office.

B. HARWOOD, Tr. W.S. Md.

FROM THE NEW MONTHLY MAGAZINE.

I love to hear at mournful eve The ploughman's pensive tone, And still be wending on my way When the last note is done.

I love to see the misty moon, And cross the gusty hill, And wind the darksome homeward lane When all is hush'd and still.

From way thus distant, lone and late, How sweet it is to come, And, leaving all behind so drear, Approach our pleasant home.

While every lowly lattice shines Along the village street, Where round the blazing evening fire The cheerful household meet!

And passing by each friendly door, At length we reach our own,-And find the smile of kindend love More kind by absence gro.

To sit beside the fire, and hear The threatening storm come on,-And think upon the dreary way, And traveller alone.

To see the social tea prepared, And hear the kettle's hum, And still repeated from each tongue-" How glad we are you're come !"

To sip our tea, to laugh and chat With heartfelt, social mirth, And think no spot in all the world Like our own pleasant hearth.

To The MARYLAND AGRICULTURAL SOCIETY, agreeably to publick notice, met at their Room on Monday last,—Col N. M. Bosley having taken vered from Piscataway Inspection Warehouse the chair, the Society proceeded to the election PRICES IN THE BALTIMORE MARKET. during the quarter commencing on the 5th Oct. of a President, when, on counting the ballots, it appeared that GENERAL CHARLES RIDGELY OF Corn, yellow and white, 35 to 36-Flaxseed, 80-HAMPTON was unanimously elected.

> authorized and requested to wait on Gen. Ridgely, -Georgia, Upland, 16 to 18 cents-Alaba his acceptance of the trust.

[Since the above was in type, we have received the following.]

the Maryland Agricultural Society.

Dear Sir,-The undersigned, deputed by the Maryland Agricultural Society to announce to Gen. Charles Ridgely of Hampton, his unanimous election as President thereof, have the pleasure to inform the Society, through you, of his acceptance of the appointment.

Most respectfully,

N. M. BOSLEY. D. WILLIAMSON, JR.

Baltimore, 6th March, 1825.

An index and title page for this volume will be issued next week. The advance is now due for the next volume.

17 PRICES OF COUNTRY PRODUCE AT HOME If Prices of Country Produce at home AND ABROAD.—Our reports under this head, comcommencing with the first number of the next tween the dates of 1790 and 1814, a legacy has been bequeathed to said Warner M. Veasey by volume, will be more ample and satisfactory than heretofore.

The COLUMBIA packet ship from Liverpool to New-York, brings Liverpool dates to the 16th, and London to the 14th of February. The prices of Cotton and Tobacco were still advancing, as

will be seen by our extracts below.

The British Parliament is chiefly occupied with debates on the suppression of the Irish Catholic Association. A French Paris paper, the Quotidienne, states that Spain, in alliance offensive and defensive with Russia, was about to declare war against England.

Igers' Liverpool Advertiser.

more inquiry this week for Montreal Pot Ashes, and small lots of Pearls continue to be taken at the prices quoted. Both Carolina and East India Rice have been in better demand. No sales have yet been made in new Flaxseed.

The sales in Turpentine have been considerable, at an advance of 3d per cwt.-Nothing has taken place in Tar.

Liverpool Market, Feb. 15.

During the past week the demand for Cotton has been particularly brisk from the trade as well as from speculators, the latter of whom, directing their attention to the comparatively low price of Pernams, have bought extensively in that description, causing an advance of full 3d. per lb. upon our last week's prices; other kinds have likewise participated in the advance 1d. to 1d. per lb. beweek are comparatively trifling, being only 6,900 American, 1330 Bahia, and 970 Egyptian.

Sca Island Georgia, 1s. 51d. to 2s. 3d.; Stained, do. 94k. to 1s. 2d.; Upland, do. 84d. to 1s.; Alabama and Tennessee, 93d. to 114d.; N. Orleans,

103d. to 1s. 14d.

Red Wheat, 90 to 95 cents-white, 95 to 105-Wharf Flour, \$4.625 to \$4.75—Susquehanna, do. \$4.625—Wheat, 90 to 93 cts.—Bacon and Hams, On motion of Mr. B. Morris, it was "Resolved, \$4.623—Wheat, 90 to 93 cts.—Bacon and Hams that Col. N. M. Bosley and D. Williamson, Jr. be 7 to 11 cents—Cotton, Louisiana, 17 to 19 cents—Cotton, Louisiana, 18 cents—Cotton, 18 cents—Cotto and inform him of his having been unanimously 15 a 16 cts.-Cotton yarn, No, 10, 32 cts. with an elected President of the Maryland Agricultural advance of 1 cent each No. to 18-Coal, pit, for-Society, and in the name of the Society, solicit eign, per bushel, 40 cts .- Do. Virginia, 20 to 25-Susquehanna, per ton, \$6 50 a \$7-Feathers, live, per lb. 33 cts.—Herrings. Susquehanna, \$2 a \$2 12 —Flax seed, rough, per bushel, 90 cts.—Hops, fresh, per lb. 14 cts.-Hides, dried, 12 a 18 cts.-Hogs lard, 9 cts.-Lime, per bushel, 23 a 25 cts.-Meal, corn, kiln dried, per bbl \$2 25 a \$2 37 1 Pork, Baltimore mess, \$14 a 15-Do. prime, \$10 50 a \$11-Rice, fresh per cwt. lbs. \$3 50.

MARYLAND TOBACCO .- The old crop has been nearly all sold. Of the new, but a small quantity has yet been brought to market; and it is difficult to pen the prices at which it is likely to open -Such as has been sold, has gone off at prices that would have been considered good at any time within the last year.

Information Wanted.

The subscriber being an heir of Warner Miflin a gentleman of the State of Maryland, whose name is not certainly known, but believe to be Missin, or Veasey. Any information on the sub-ject will be thankfully received. If the clerk of the court, in which such will is recorded, will forward a copy to me at Turner's Roads, Bertie County, (North Carolina,) he shall be handsomely compensated.

JESSE AVERITT.
